WEATHER BUREAU OFFICE  
FEBRUARY 26, 1920.

B

Departure of the Mean Temperature from the Normal, January, 1920.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., JANUARY, 1920.

No. 1.

## GENERAL SUMMARY.

The cold weather of the mid-winter month, January 1920, was notable as one of the five coldest since State averages were first compiled in 1885. The cumulative effect of steadily sub-normal warmth during the coldest season of the year is such as to produce an impression that such extreme conditions have not recently occurred, if ever, but January 1918, was the coldest January on record, being three degrees colder than this year. On the 1st, the temperature was slightly above normal, and similar conditions occurred from the 7th to 9th, and on the 13th and 30th. The coldest periods were on the 3d to 5th, 19th, 26th, and 31st. Ice in streams and ponds formed to thicknesses of 15 to 20 inches, and ice cutting was carried on on a large scale. The principal dates of snow, the 16th, 17th, 19th and 22d, furnished a light covering over the greater portion of the State, but it had practically disappeared at the close of the month. In northern districts there was considerable sleighing. There were frequent occurrences of high wind, velocities of 40 miles per hour or more, from the northwesterly quadrant on four days being recorded. The month closed with a severe cold wave, temperatures falling from in the 40's on the 30th to below zero on the 31st, attendant upon exceedingly high atmospheric pressure, (30.98 inches.) Other cold waves occurred on the 2d, 14th and 29th.

## TEMPERATURE.

The monthly mean temperature of the State as deduced from observations of 41 stations, was 23.6°, which was 6.2° below normal. The highest temperature was 53° at Atlantic City and Tuckerton on the 30th, and the lowest, 14° below zero at Culvers Lake on the 26th and 31st. The greatest daily range of temperature was 43° at Sussex on the 31st. The highest monthly mean was 28.9° at Cape May City and the lowest, 18.0 at Newton.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 46 stations, was 2.60 inches, which was 1.21 inch below normal. The greatest monthly precipitation was 3.53 inches at Hammonton, and the lowest, 1.61 inches at Charlotteburg. The average total snowfall was 6.6 inches, which was 2.1 inches below normal; this average depth ranged from 9.4 inches in the Highlands to 4.1 inches in the Southern Interior. The greatest precipitation accumulated in 24 hours

was 1.29 inches at Culvers Lake on the 9th. The average number of days on which 0.01 inch or more of precipitation fell was 11, which is the normal.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which is 1 more than normal; partly cloudy days, 7, or two less than normal; cloudy, 13, or 1 more than normal. The approximate percent of possible sunshine was 48, and was probably somewhat below normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.20 inches, which was 0.09 inch above normal. The highest reading was 30.98 inches at Sandy Hook and Trenton on the 31st, and the lowest, 29.47 inches at Atlantic City on the 17th.

The mean stage of the Delaware River at Phillipsburg was 2.2 feet. At Trenton the mean daily stage was 3.1 feet, which was 0.5 foot below normal. The highest stage was 5.6 feet on the 10th and the lowest 2.2 feet on the 26th and 27th.

Dense fog occurred on the 1st, 2d, 3d, 8th and 9th. Haze occurred on the 1st, 21st and 24th. Sleet was observed at a few stations on the 1st, 7th, 8th and 25th, and quite generally throughout the State on the 9th, 20th, 21st, 22d, 23d, 24th and 27th. Solar halos were observed on the 3d, 6th, and 26th, and a lunar halo on the 2d, 3d, and 7th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

‡ Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Hackensack; Ridgefield is Morserene.

Daily precipitation for January, 1920.

# Departure of the Mean Temperature from the Normal, February, 1920.

Shaded portions show excess (+).  
 Unshaded portions show deficiency (-).  
 Lines show amount of excess or deficiency.

## U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., FEBRUARY, 1920.

No. 2.

## GENERAL SUMMARY.

February in New Jersey is frequently as cold or colder than January, so that the general severity of a winter is often rendered more impressive by the conditions that prevail in February. In 1920 the month was cold very continuously, but not quite so cold as January. The first day of February was below zero over nearly all the State, but it became more moderate, and there was a period of thawing weather from the 10th to the 14th, and one very warm day on the 18th, but thereafter temperatures were almost continuously subnormal. A severe storm on the 4th-5th-6th, consisting mostly of sleet, but with some drifting snow, very effectually blocked traffic until the 10th, in northern and central portions of the State. Some country roads in northern districts were not opened at all, and travelers went across fields, where possible. There having been so much sleet, after a few days with a little mid-day thawing, the ground became coated with three to six inches of solid ice. Later occurrences of snow maintained the ice and snow cover on the ground through the close of the month. Highway traffic was impeded more than ever before since the advent of the motor truck, and, with gradual opening of travel, an enormous amount of damage to road surfaces occurred. Rail traffic, except street car lines, was not seriously disrupted. Conditions in southern counties were far less severe, but in extreme northern counties some roads were totally blocked at the close of the month, except to equestrians or sleighs.

Practically a maximum ice crop was harvested. The average thickness of ice in the Delaware, above tidewater, ranged from about 10 to 20 inches, being 18 inches at Trenton at the close of the month.

This month was a spectacular contrast with that of one year ago, when no inconsiderable amount of plowing and planting was accomplished.

## TEMPERATURE.

The monthly mean temperature of the State as deduced from observations of 41 stations, was 27.9°, which was 2.1° below normal. The highest temperature was 54° at Vineland on the 18th, and the lowest, 25° below zero at Culvers Lake on the 15th. The greatest daily range of temperature was 40° at Sussex on the 1st. The highest monthly mean was 31.6° at Bridgeton, and the lowest, 22.9° at Layton.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 46 stations, was 4.20 inches, which was 0.26 inch above normal. The greatest monthly precipitation was 7.20 inches at Tuckerton, and the lowest, 2.39 inches at Clayton. The average total snowfall was 20.0 inches, which was

9.8 inches above normal; this average depth ranged from 24.1 in the Highlands to 14.8 inches in the Southern Interior. The greatest precipitation accumulated in 24 hours was 2.68 inches at Trenton on the 4th-5th. The average number of days on which 0.01 inch or more of precipitation fell was 11, which was 2 more than normal.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11; partly cloudy days, 8; cloudy days, 10, which was normal. The approximate percent of possible sunshine was 51, and was probably somewhat below normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.01 inches, which was 0.09 inch below normal. The highest reading was 31.00 inches at Newark and Palisades Park on the 1st, and the lowest, 29.35 inches at Palisades Park on the 25th.

The mean stage of the Delaware River at Phillipsburg was not recorded; river frozen. At Trenton the mean daily stage was 2.6 feet, which was 0.9 feet below normal. The highest was 3.1 feet on the 10th and lowest 2.3 feet on the 2d, 6th, 7th.

Dense fog occurred on the 2d, 3d, 22d, 23d, 24th. Haze occurred on the 4th and 11th. Sleet was observed at a few stations on the 10th, 13th, 21st, 22d, and quite generally throughout the State on the 4th, 5th, 6th, and 23d. Solar halos were observed on the 7th, 11th, 12th, 13th, 21st, 28th. Thunderstorms occurred at a few stations on the 14th and 15th; an ice storm on the 13th; and hail occurred at a few stations on the 14th and 22d.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Hackensack; Ridgefield is Morseineere.

MAY 21, 1920.

Departure of the Mean Temperature from the Normal, March, 1920.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., MARCH, 1920. No. 3.

GENERAL SUMMARY.

The month of March brought forth typical weather conditions, for the opening of the spring season in New Jersey. Rain, snow, temperature, wind and cloudiness did not vary greatly from normal. The contrast with March 1919, was marked, owing chiefly to the mildness of the weather then. The first and third weeks were mostly subnormal in warmth, while the remaining periods were generally warmer than normal, the month closing with a notably pleasant warm wave. March gales were hardly more noticeable than normal, but, as usual, they accompanied falls of snow or rain. Highway traffic continued to be greatly impeded, particularly in northern districts, by the snow and ice remaining, and by the fall of sleet on the 6th, but road conditions steadily improved after the 21st. The ice in the Delaware, which was some 18 inches thick, more or less, went out of the lower river on the 4th, and navigation in tide-water was resumed on the 10th. On the night of the 13th-14th, the ice in the upper river, above Phillipsburg, broke and commenced running with great volume, velocity and in cakes of great weight. The situation was very dangerous, but no jam occurred, and there was only such minor damage as caused by the scouring and grinding of ice cakes.

The display of the Aurora Borealis on the evening of the 22d, was one of the most brilliant occurrences observed in this latitude, and at about 10 p. m., telegraph communications was almost totally interrupted by the electrical interference.

TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 41 stations was 39.4°, which was 1.4° above the normal. The highest temperature was 79° at Flemington on the 31st, and the lowest, -8° at Layton on the 8th. The highest monthly mean temperature was 43.2° at Bridgeton, and the lowest, 34.6° at Layton. The greatest daily range of temperature was 48° at Belvidere on the 25th. The temperature departure from normal for the year 1920 to date, by sections, is: The Highlands, -2.8°; Red Sandstone Plain, -2.2°; Southern Interior, -2.0°; Sea Coast, -2.4°.

PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations was 3.80 inches, which was 0.24 inch below the normal. The mean total snowfall was 5.6 inches, which was 0.3 inch less than the normal. The greatest monthly precipitation was 5.36 inches at Dover, and the least, 2.29 inches at Asbury Park. The greatest amount of precipitation in any 24 consecutive hours was 3.43 inches at Charlotteburg on the 5th. The mean number of days on which 0.01 inch or more precipitation occurred was 10, which was 1 less than the normal. The precipitation accumulated departure from the normal for the year 1920 to date, by sections, is: The Highlands, -1.94 inches; Red Sandstone Plain, -0.43 inch; Southern Interior, -1.07 inches; Sea Coast, -1.37 inches.

WIND.

The prevailing wind direction was from the northwest, with

an approximate velocity of 13 miles per hour, which was somewhat greater than the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 74 miles per hour from the northwest on the 17th at Long Branch. High winds were also reported on the 5th, 6th, 12th, and 13th.

SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 17, which was 3 more than the normal; partly cloudy, 5, which was 3 less than the normal; cloudy, 9, which was normal. The mean percent of possible sunshine approximated 66, and was 7% above the normal.

MISCELLANEOUS.

The mean daily stage of the Delaware River at Phillipsburg was 8.1 feet, the highest being 16.4 feet on the 1st. At Trenton the mean daily stage was 5.7 feet, which was 1.8 feet above the normal; the highest stage was 11.1 feet on the 14th.

The mean atmospheric pressure, reduced to sea level, was 30.03 inches, which was 0.02 inch above the normal. The highest reading, 30.55 inches, occurred at Sandy Hook on the 3d, and the lowest, 29.05 inches, on the 13th, also at Sandy Hook. Dense fog was reported on the 4th, 5th, 6th, 11th, 12th, 13th, 16th, 24th, 26th, 27th and 29th; and haze on the 2d, 3d, 11th and 31st. Sleet occurred on the 4th, 5th, 6th, 13th and 19th; and hail on the 13th and 29th. The aurora was observed on the 22d, 23d, 24th and 25th. Solar halos were observed on the 8th, 14th, 15th, 16th, 22d and 28th; and lunar halos on the 30th and 31st. Thunderstorms occurred on the 5th, 26th, 29th and 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Hackensack; Ridgefield is Morsemere.

Daily precipitation for March, 1920.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV.

TRENTON, N. J., APRIL, 1920.

No. 4.

## GENERAL SUMMARY.

Weather conditions varied only slightly from normal during April, 1920, in New Jersey. Typical changeableness, sunshine and showers, gentle and turbulent winds, were the characteristic features. A warm period prevailed the first of the month for a few days, and again from the 19th to the 23d, but the remaining periods were mostly subnormal in warmth. Rains fell very generally on the first 9 days of the month, and on the 13th, 16th, 17th, 21st, 23d, 24th, 27th, 28th and 30th.

While the amount of sunshine and rain was slightly above normal, the low temperature and frequency of rain contributed in marked degree to interfering with farming and other out-of-door operations, and crop growth and germination were decidedly backward. Some phenological criteria, however, showed the season to be only a day or two later than usual.

Highways returned to passable condition but slowly, and motor traffic on nearly all roads was interrupted considerably. The use of the roads by heavy trucks while frost was leaving the ground, and before settling, has become a grave menace to the permanence of the most highly skilled road building. During the winter ending a year ago, there was practically no frost in the ground, but this year the ground was frozen deeply, and for a prolonged period.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 40 stations was 48.0°, which was 1.0° below the normal. The highest temperature was 85° at Bridgeton on the 23d, and the lowest, 10° at Culvers Lake on the 9th. The highest monthly mean temperature was 52.5° at Bridgeton, and the lowest, 43.8° at Charlotte. The greatest daily range of temperature was 42° at Layton on the 20th. The temperature departure from the normal for the year 1920 to date, by sections, is: The Highlands, -2.8°; Red Sandstone Plain, -1.9°; Southern Interior, -1.5°; Sea Coast, -1.9°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 45 stations was 4.50 inches, which was 0.93 inch above the normal. The mean total snowfall was trace, which was 0.8 inch less than the normal. The greatest monthly precipitation was 6.06 inches at Long Branch, and the least, 2.90 inches at Cape May City. The greatest amount of precipitation in any 24 consecutive hours was 2.02 inches at Charlotteburg on the 4th-5th. The mean number of days on which 0.01 inch or more precipitation occurred was 13, which was 3 more than the normal. The precipitation accumulated departure from the normal for the year 1920 to date, by sections, is: The Highlands, -0.17 inch; Red Sandstone Plain, +0.70 inch; Southern Interior, -0.67 inch; Sea Coast, -0.77 inch.

## WIND.

The prevailing direction was from the northwest, with an approximate velocity of 12 miles per hour, which was about normal. The highest wind velocity, sustained for 5 consecutive minutes, was 66 miles per hour from the northwest on the 23d at Long Branch. High winds were also reported on the 5th, 6th, 13th and 24th.

## SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 12, which was 1 more than the normal; partly cloudy, 9, which was 1 less than the normal; cloudy, 9, which was normal. The mean percent. of possible sunshine approximated 58, and was about normal.

## MISCELLANEOUS.

The mean daily stage of the Delaware River at Phillipsburg was 6.6 feet, the highest being 10.9 feet on the 3d. At Trenton the mean daily stage was 4.4 feet, which was 0.4 foot above the normal; the highest stage was 6.7 feet on the 14th.

The mean atmospheric pressure, reduced to sea level, was 29.84 inches, which was 0.16 inch below the normal. The highest reading, 30.23 inches, occurred at Cape May City on the 26th, and the lowest, 29.12 inches, at Sandy Hook on the 5th.

Dense fog was reported on the 1st, 2d, 4th, 5th, 21st, 23d and 27th. Hail fell on the 4th, 5th, 11th, 23d and 24th, but no damage resulted. The aurora was observed on the 18th, 19th and 20th. Solar halos were observed on the 1st, 6th, 10th, 11th, 12th, 20th, 26th and 30th; and a lunar halo on the 25th. Thunderstorms occurred on the 1st, 2d, 5th, 11th, 20th, 21st, 22d, 23d and 24th. The last killing frost of Spring occurred quite generally on the 26th and at several stations as late as the 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Hackensack; Ridgefield is Monmouth.

Daily precipitation for April, 1920.

WEATHER BUREAU OFFICE  
JUNE 21, 1920.

Departure of the Mean Temperature from the Normal, May, 1920.

Shaded portions show excess (+).  
Unshaded portions show deficiency (-).  
Lines show amount of excess or deficiency.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV.

TRENTON, N. J., MAY, 1920.

No. 5.

## GENERAL SUMMARY.

The weather during May was disappointing in that it was cool, and that there were but few warm days that were also clear. Warmth was deficient practically without cessation through the 18th, but thereafter there was a fair share of warm and pleasant weather, except for cloudy and cool conditions, with raw easterly winds on the 23d and 24th. It was one of the four coldest Mays in the past 35 years.

Starting with a deficiency in ground heat, it was an unfavorable month for seed germination and crop growth; the humidity was low and the soil was dry and cold. This, following an unfavorable winter, afforded an unpleasant aspect for the opening of the active agricultural year. There was adequate sunshine, and no dangerously late frosts, but the retarding effects of cool nights could not be overcome. Five clear and warm days at the close of the month were notably low in humidity, and were very agreeable for out-of-door interests.

An interesting series of some 12 rainy Fridays in succession, ended on the 21st; a fact of no material import, but upon which there was general comment.

No storm warnings were displayed during the month.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 40 stations, was 57.4°, which was 3.0° below the normal. The highest temperature was 89° at Inlaystown on the 28th, and the lowest, 25° at Culvers Lake on the 5th and 6th. The highest monthly mean temperature was 60.3° at Vineland, and the lowest mean, 53.2° at Long Branch. The greatest daily range of temperature was 47° at Inlaystown on the 17th.

The temperature departure from the normal for the year 1920 to date, by sections is: The Highlands, -2.7°; Red Sandstone Plain, -2.1°; Southern Interior, -2.0°; Sea Coast, -2.2°.

## PRECIPITATION.

The average total rainfall of the State, as deduced from observations of 45 stations, was 3.00 inches, which was 0.83 inch less than the normal. The greatest monthly amount was 5.23 inches at Tuckerton, and the least, 1.61 inches at Atlantic City. The greatest amount accumulated in any 24 consecutive hours was 2.67 inches at Tuckerton on the 21st. The average number of days on which .01 inch or more of rain fell was 10, which was one less than the normal. There was a trace of snow at Culvers Lake on the 4th. The accumulated precipitation departure from the normal for the year 1920 to date, by sections is: The Highlands, -0.85 inch; Red Sandstone Plain, -0.21 inch; Southern Interior, -1.44 inches; Sea Coast, -1.77 inches.

## WIND.

The prevailing direction was from the northeast, with an approximate velocity of 10 miles per hour, which was slightly be-

low the normal. The highest velocity, sustained for 5 consecutive minutes, was 48 miles per hour from the northwest on the 21st at Long Branch. High winds were also noted on the 1st, 4th, 22d and 23d.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was three more than the normal; partly cloudy, 8, or two less than the normal; cloudy, 8, or one less than the normal. The approximate percentage of possible sunshine was 63, and was somewhat above the normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.07 inches, which was 0.08 inch above the normal. The highest reading was 30.54 inches at Cape May City on the 17th, and the lowest, 29.60 inches at Atlantic City and Sandy Hook on the 1st.

The mean stage of the Delaware River at Phillipsburg was 3.5 feet, and the highest stage, 4.6 feet on the 1st and 2d. At Trenton the mean daily stage was 2.4 feet, which was 0.3 foot below the normal; the highest stage was 3.3 feet on the 1st.

Killing frosts were recorded in most portions of the State on the 3d, 5th and 6th, and light to heavy frosts as late as the 17th. Thunderstorms occurred in some portions of the State on the 1st, 4th, 10th, 11th, 21st and 22d. Hail occurred in Morris County on the 4th, and quite generally throughout the State on the 21st. No material damage was reported. Solar halos were observed on the 6th, 7th, 11th, 12th, 18th and 19th. Fog was observed on the 5th, 20th, 21st, 28th and 31st. Light haze prevailed over portions of the State on the 10th, 11th, 19th, 22d, 25th, 27th and 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Hackensack; Ridgefield is Morsemere; Indian Mills is Atsion.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., JUNE, 1920. No. 6.

## GENERAL SUMMARY.

June was a rainy month, with a fairly uniform frequency of occurrence over most of the State. Notably heavy falls were recorded from the 3d to 5th, on the 13th, 16th, 17th, 29th and 30th. Amounts in excess of 3 inches in 24 consecutive hours occurred at Bridgeton, Clayton, Indian Mills, Lakewood and Vineland, and over 4 inches at Long Branch. At Trenton 1.68 inches fell in 27 minutes on the 30th, which is a notably excessive rate. The only periods of the month that were generally dry were the 1st, 2d, 6th to 11th, and 26th to 28th. As a whole, the month will go on record as one of the rainiest, although not breaking the records of 1887, 1902 and 1903.

Temperatures and cloudiness occurred more nearly in accord with the usual course of June, although cool nights and lack of bright sunshine maintained crops in a continued backward state. A short three days of warmth the first of the month was followed by subnormal temperature until the 11th, when it again became warm but not bright and clear, until the 16th. Hereafter it was cool through the 25th, but from the 26th to the close of the month, day-time temperatures were generally in the 80's and 90's.

Wind squalls of some moment occurred with the thunderstorms of the 15th, 16th, 17th, 24th, 29th and 30th and in connection with the beating rain, grass and grain became lodged. Storm warnings were displayed on the 17th and 20th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 40 stations, was 68.4°, which was 0.8° below the normal. The highest temperature was 98° at Inlaystown on the 29th, and the lowest 38° at Charlotteburg on the 8th. The highest monthly mean temperature was 72.4° at Vineland, and the lowest, 62.8° at Charlotteburg. The greatest daily range of temperature was 41° at Layton on the 11th. The temperature departure from the normal for the year 1920, to date, in sections is: The Highlands, -2.5°; Red Sandstone Plain, -1.9°; Southern Interior, -1.7°; The Sea Coast, -2.0°.

## PRECIPITATION.

The average total rainfall for the State, as deduced from observations of 46 stations, was 6.18 inches, which was 2.8 inches above the normal. The greatest monthly amount was 11.26 inches at Pleasantville, and the least, 3.12 inches at Phillipsburg. The greatest amount of rain in 24 consecutive hours was 9.09 inches at Long Branch on the 5th. The average number of days on which 0.01 inch or more rain fell was 12, which was more than the normal.

The precipitation accumulated departure from the normal for the year 1920 to date is: The Highlands, -0.05 inch; Red

Sandstone Plain, +1.41 inches; Southern Interior, +2.28 inches; The Sea Coast, +1.78 inches.

## WIND.

The prevailing wind direction for the month was from the southwest, with an approximate velocity of 9 miles per hour, which was about the normal. The highest velocity for the month, sustained for five consecutive minutes, was 78 miles per hour from the northwest on the 16th at Long Branch. High winds were also noted on the 7th, 17th, 24th, 29th and 30th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than the normal; partly cloudy, 9, which was 2 less than the normal; cloudy 8, which was 1 more than the normal. The approximate percentage of possible sunshine was 59, probably about the normal value.

## MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 2.5 feet, and the highest, 5.3 feet on the 19th. At Trenton the mean daily stage was 1.7 feet, which was 0.5 feet below the normal; The highest stage was 3.2 feet on the 20th.

The mean atmospheric pressure, reduced to sea level, was 29.97 inches, which was 0.01 inch below the normal. The highest reading was 30.35 inches at Cape May City on the 27th, and the lowest, 29.43 inches at Atlantic City on the 17th.

Thunderstorms occurred in some portions of the State on the 2d, 3d, 5th, 8th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 21st, 22d, 24th, 25th, 29th and 30th. Solar halos were observed on the 1st, 8th, 11th, 16th, 19th and 20th. Fog was observed on the 13th, 17th, 21st and 28th. Smoke was noted on the 18th and 24th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Hackensack; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily precipitation for June, 1920.

NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., JULY, 1920. No. 7.

GENERAL SUMMARY.

There was a distinct line of demarcation across the State, corresponding closely to the southern margin of the Red Sandstone Plain, separating a zone of severe storms in the north from normally pleasant midsummer weather in the south. Although the warmth was somewhat deficient throughout the State, the lack of moisture in the south was not an outstanding feature. In the northern half, however, the surplus of rain was in especially detrimental quantities. On the 18th in the evening a storm of some tornadic characteristics caused destruction in the southeastern portions of Phillipsburg. Torrents of rain and destructive winds caused pronounced damage to objects not of the most durable structure. The peculiar explosive effect on tightly closed buildings usually seen in typical tornadoes, was not present, and many fatalities were doubtless thereby avoided. On the 23d-24th notably heavy rains fell in the northern half of the State, amounts in excess of 5 inches in 24 consecutive hours having occurred at Newark and Newton. While crop growth in most of the southern half of the State was in some need of more rain, vegetation was being injured from surplus moisture to the northward.

No marine storm warnings along the coast were displayed during the month.

TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 39 stations, was 71.7°, which was 1.9° below the normal. The highest temperature was 96° at Bridgeton on the 24th, and the lowest, 42° at Charlotteburg on the 18th and 27th, Culvers Lake on the 26th and 27th, and Layton on the 27th. The highest monthly mean temperature was 75.4° at Bridgeton, and the lowest, 66.4° at Charlotteburg. The greatest daily range of temperature was 38° at Indian Mills on the 28th and Layton on the 27th. The temperature departure for the year 1920 to date, by sections, is: The Highlands, -2.4°; Red Sandstone Plain, -1.9°; Southern Interior, -1.7°; Sea Coast, -2.1°.

PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 42 stations was 5.76 inches, which was 0.96 inch above the normal. The greatest monthly rainfall was 16.25 inches at Newark, and the least, 1.20 inches at Asbury Park. The greatest amount of rain in any 24 consecutive hours was 5.36 inches at Newton on the 24th. The mean of the number of days on which 0.01 inch or more rain fell was 11, which was 1 more than the normal. The precipitation accumulated departure from the normal, for the year 1920 to date, by sections, is: The Highlands, +3.94 inches; Red Sandstone Plain, +4.26 inches; Southern Interior, +0.56 inch; Sea Coast, -0.07 inch.

WIND.

The prevailing wind direction was from the southwest, with an approximate velocity of 9 miles per hour, which was slightly below the normal. The highest velocity, sustained for 5 consecutive minutes, was 50 miles per hour from the northwest on the 31st at Long Branch.

SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 17, which was 5 more than the normal; partly cloudy, 10, or 2 less than the normal; cloudy, 4, or 3 less than the normal. The approximate percent. of possible sunshine was 73, which was about 10 percent. above the normal.

MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 2.9 feet, and the highest stage, 8.4 feet on the 25th. At Trenton the mean stage was 2.0 feet, which was 0.8 foot above the normal. The highest stage, 5.8 feet, occurred on the 26th.

Mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was 0.02 inch above the normal. The highest reading was 30.28 inches at Cape May City on the 29th, and the lowest, 29.52 inches at Sandy Hook on the 3d.

Thunderstorms occurred in some portions of the State daily from the 1st to 4th, 7th to the 24th, except the 10th, 17th, 20th and 21st, and on the 30th and 31st. Dense fog was observed daily from the 9th to 14th and on the 22d and 23d. Hail occurred on the 3d at Cape May City, 22d at Jersey City, Somerville and South Orange, 23d at Chatham, 24th at Bergen Point, Jersey City, Layton, and Rancocas, and on the 31st at Chatham. It was not of sufficient severity to occasion special reports.

JUNE HAIL.

June 11th, Adelphia, Bridgeton, Freehold, Lakewood, and Ridgefield: hail varying in size from peas to hickory nuts did considerable damage to crops and fruit trees. June 13th, Bridgeton, Burlington, Cedarville, and Fairton, hail about one-fourth to one half-inch in diameter did much damage to crops, causing losses approximating \$6,000 at Cedarville and Fairton. June 14th, Bridgeton, hail about the size of peas and marbles caused slight damage to tender vegetation. June 15th, New Brunswick, hail one-eighth to one-fourth inch in diameter did very little damage. June 16th, Clayton, hail about the size of a ten-cent piece did slight damage. June 17th, Folsom, hail large as pigeon eggs did about \$3,000 damage to crops. June 22d, Culvers Lake and Flemington Junction, hail the size of peas caused no material damage. June 24th, Boonton, Mt. Bethel, and Pluckemin, hail from one-fourth to one inch in diameter did considerable damage at Mt. Bethel only. June 29th, Elizabeth, Imlaystown, New Brunswick, Newton, Paterson, and Trenton, hail varying in size from large peas to walnuts did severe damage to crops and fruit trees. June 30th, Hammonton, hail the size of plums caused moderate damage to crops.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily precipitation for July, 1920.

SEPTEMBER 20, 1920.

Departure of the Mean Temperature from the Normal, August, 1920.

Shaded portions show excess (+).  
Unshaded portions show deficiency (-).  
Lines show amount of excess or deficiency.

## U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV.

TRENTON, N. J., AUGUST, 1920.

No. 8.

## GENERAL SUMMARY.

The weather during August in New Jersey produced one remarkably outstanding feature, namely, the frequency with which rain occurred. There have been many months with heavier rainfall, but this exceeds all records of the State as regards frequency, there having been a State average of 17 rainy days, which was 7 days more than normal, and 4 more than the previous high August record. At individual stations, the record ranged from 10 rainy days in the extreme north, to 24 in the south-central. Other weather conditions were not remarkable, except that, as might be expected, there was a considerable excess of cloudiness and deficiency of sunshine, and long continuous periods of disagreeably oppressive humidity. In warmth, the State was a fraction of a degree above normal, except that it was cool along the immediate shore of the ocean. Previous August rainfall records show that the extremes usually vary from less than an inch to considerably over ten inches, so that as a rule, a wide diversity of rainfall characteristics is to be looked for in New Jersey in August.

The crop situation as a whole was favorable. The rainy weather interfered with the harvesting of grass and grain, and with farm work generally, and crops became very weedy, but development was greatly favored, and all crops indicated large yields, and practically regained all lost time from a belated start in spring.

No storm warnings were displayed during the month.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 72.3°, which was 0.3° above normal. The highest temperature was 94° at Little Falls and Plainfield on the 17th, and the lowest, 42° at Charlotteburg on the 4th. The highest monthly mean was 75.1° at Burlington, and the lowest mean, 69.2° at Charlotteburg. The greatest daily range of temperature was 37° at Charlotteburg on the 4th. The temperature departure from normal for the year 1920 to date, by sections, is: The Highlands, -2.0°; Red Sandstone Plain, -1.6°; Southern Interior, -1.4°; Sea Coast, -2.0°.

## PRECIPITATION.

The average total rainfall of the State, as deduced from observations of 44 stations, was 6.10 inches, which was 1.31 inches more than normal. The greatest monthly amount was 10.60 inches at Moorestown, and the least, 2.94 at Elizabeth. The greatest amount accumulated in any 24 consecutive hours, was 3.15 inches at Indian Mills on the 6th. The average number of days on which 0.01 inch or more precipitation occurred, was 17, which was 7 more than normal. From the 5th to 24th it rained in nearly every portion of the State, and at some stations rain fell every day but one, of that period.

The accumulated precipitation departure from normal for the year 1920 to date, by sections, is: The Highlands, +4.60 inches; Red Sandstone Plain, +5.54 inches; Southern Interior, +2.18 inches; Sea Coast, +1.40 inches.

## WIND.

The prevailing wind movement was from the southwest, with an average velocity of about 9 miles per hour which was approximately normal. The highest velocity, sustained for 5 consecu-

tive minutes, was 51 miles per hour from the southwest, at Long Branch, on the 9th. Velocities of considerable force also occurred on the 7th, 17th, and 31st.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 8, which was 5 fewer than normal; partly cloudy, 11, or normal; cloudy, 12, or 5 more than normal. The per cent. of possible sunshine approximated 51, which was considerably below normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.07 inches, which was .07 inch above normal. The pressure ranged from 30.35 inches to 29.66 inches.

The mean stage of the Delaware River at Phillipsburg was 2.6 feet, the highest stage being 4.7 feet on the 19th. At Trenton the mean daily stage was 2.0 feet, which was 1.0 foot above normal; the highest stage was 3.2 feet on the 18th.

Hail occurred at South Orange and Burlington on the 31st, with but little material damage. Solar halos were observed on the 3d, 4th, 5th, and 26th. Thunderstorms occurred on the 1st, 2d, 6th to 18th, inclusive, 22d, 28th, 29th, 31st.

Dense fog occurred on the 6th, 7th, 11th, 12th, 13th, 15th to 18th, 21st and 22d.

## ERRATA.

October, 1919: Page 76:—Hightstown, mean temperature should read 59.6° instead of 58.8°. Page 78. Hightstown, mean maximum temperature should read 69.2° instead of 67.5°, and the maximum temperature on the 28th should be omitted.

May, 1920: Page 36:—Indian Mills, mean temperature should read 57.4° instead of 57.8°.

July, 1920: Page 52:—Elizabeth, mean temperature should read 72.4° instead of 72.2°b. Number of clear days, 15, partly cloudy, 14, and cloudy, 2. Page 54: Elizabeth, maximum temperature on the 10th should read 82°; and the 11th, 83°; minimum temperature on the 10th, 67°, and the 11th, 68°. Mean maximum temperature should read 84.6° instead of 84.7°b, and the mean minimum temperature should read 60.3° instead of 59.8°b.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., SEPTEMBER, 1920. No. 9.

GENERAL SUMMARY.

The weather of September was a very agreeable contrast with that of the preceding month. There was a slight excess of warmth, sunshine and clear skies, above normal conditions, and a deficiency of rain and wind, except that excessive rain fell in the The Kittatinny Highlands. There was one long period, from the 12th to the 25th, practically without rain. The first cold weather of autumn occurred on the 20th, when temperatures of 30° with killing frost, occurred in some portions of extreme northern districts and light frost in the interior of southern portions. This, in turn, was followed by warmer weather, and the 25th was one of the warmest days of the month. By far the greatest amount of monthly rain occurred on the 30th, the record of some of which is recorded on October 1st; except for this rainstorm, the monthly deficiency would have been considerably in excess of an inch.

The effect of weather on crops was altogether favorable, vegetation advanced to maturity without hindering circumstances, and yields were generally indicative of fine quantity and quality.

Storm warnings were displayed along the coast on the 30th.

TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 36 stations, was 66.8°, which was 1.0° above the normal. The highest temperature was 90° at Flemington on the 12th, Somerville and Vineland on the 24th, and Sussex on the 25th; and the lowest, 30° at Charlotteburg, Culvers Lake, and Layton on the 20th. The highest monthly mean temperature was 70.2° at Vineland, and the lowest, 63.1° at Charlotteburg. The greatest daily range of temperature was 42° at Indian Mills on the 20th.

The temperature departure from the normal for the year 1920 to date, by sections, is: The Highlands, -1.6°; Red Sandstone Plain, -1.4°; Southern Interior, -1.2°; Sea Coast, -1.8°.

PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 44 stations, was 3.87 inches, which was 0.18 inch below the normal. The greatest monthly rainfall was 8.53 inches at Culvers Lake, and the least, 1.67 inches at Hammonton. The greatest amount of rain in any 24 consecutive hours was 4.00 inches at Charlotteburg on the 30th. The mean of the number of days on which 0.01 inch or more of rain fell was 7, or one less than the normal.

WIND.

The prevailing wind direction was from the northwest, with an approximate velocity of 9 miles an hour, which was about

the normal. The highest velocity, sustained for five consecutive minutes, was 70 miles per hour from the southeast on the 30th at Long Branch. There were high winds on the 1st, 15th, 16th and 19th.

SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 17, which was 3 more than the normal; partly cloudy, 8, or 1 less than the normal; cloudy, 5, or 2 less than the normal. The approximate percent of possible sunshine was 68, which was probably normal.

MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.01 inches, which was 0.06 inch below the normal. The highest reading was 30.35 inches at Ridgefield and Sandy Hook on the 22d, and the lowest, 29.14 inches, at Atlantic City and Sandy Hook on the 30th.

The mean stage of the Delaware River at Phillipsburg was 2.5 feet, and the highest, 6.0 feet on the 13th. At Trenton the mean stage was 1.6 feet, which was 0.5 foot above the normal. The highest stage, 2.9 feet, occurred on the 14th.

Thunderstorms occurred in some portions of the State on the 9th, 10th, 11th, 12th, 26th, 27th, 28th, 29th, and 30th. Dense fog occurred on the 4th, 5th, 9th, 22d, 23d, 24th, 25th, 26th, 27th, and 29th. Smoke was noted on the 7th, and haze on the 4th. Frost formed in all counties, excepting Cape May, on the 20th, but no appreciable damage was reported. A lunar halo was observed on the 23d, and a solar halo on the 17th. The aurora was noted on the 10th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayoune; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily precipitation for September, 1920.

Departure of the mean temperature from the normal, October, 1920.

Shaded portions show excess (+).  
 Unshaded portions show deficiency (-).  
 Lines show amount of excess or deficiency.

Scale: 0 to 500 Miles, 0 to 800 Kilometers.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., OCTOBER, 1920. No. 10.

GENERAL SUMMARY.

The weather during October was remarkably fine. During the first week the warmth was slightly subnormal, but thereafter, except the last three days of the month, the temperatures were above normal, and frequently of almost summer mildness. This, in connection with a deficiency of rain both in amount and frequency of occurrence, and an excess of sunshine and clear skies, produced a period of weather of more than ordinary agreeableness. The days on which cloudiness was most noticeable were the 1st, 12th, 16th, 18th, 19th, 27th, and 28th. Most of the rain and occurrences of thunder occurred on these dates.

Many instances of heavy rain recorded on the 1st were for falls actually on the night of Sept. 30th-Oct. 1st, the rain having ceased before midnight, but not recorded until the next day. This rainfall was followed by a very rapid rise of the Delaware River to its maximum on the 2d of the month, after which the water gradually subsided.

Normally killing frosts penetrates to all except the most extreme south portions of the State during the last ten days of the month, but this year frost of but moderate severity only, occurred over nearly all portions on the 30th and 31st, and in many localities did not occur at all.

Storm warnings were displayed on the 27th.

TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 39 stations, was 59.0°, which was 4.8° above the normal. The highest temperature was 87° at Bergen Point on the 21st and Bridgeton on the 22d, and the lowest, 25° at Culvers Lake on the 30th. The highest monthly mean temperature was 62.2° at Cape May City, and the lowest, 56.0° at Charlotteburg. The greatest daily range of temperature was 48° at Sussex on the 9th.

The temperature departure from the normal for the year 1920, to date, by sections is: The Highlands, -0.9°; Red Sandstone Plain, -0.6°; Southern Interior, -0.7°; Sea Coast, -1.1°.

PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 44 stations, was 1.80 inches, which was 1.86 inches below the normal. The greatest monthly rainfall was 4.53 inches at Boonton, and the least, 0.55 inch at Bridgeton. The greatest amount of rain in any 24 consecutive hours was 3.53 inches at Boonton on the 1st. The mean of the number of days on which 0.01 inch or more of rain fell was 5, or 3 less than the normal. A trace of snow fell at Culvers Lake on the 29th.

The precipitation accumulated departure from the normal, for the year 1920 to date, by sections is: The Highlands, +5.86; Red Sandstone Plain, +3.20; Southern Interior, -1.02; Sea Coast, -1.55.

WIND.

The prevailing direction was from the southwest, with an approximate velocity of 10 miles per hour, which was slightly above the normal. The highest velocity, sustained for 5 consecutive minutes, was 56 miles per hour from the northwest on the 29th at Long Branch.

SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 20, or 6 more than the normal; partly cloudy, 5, or 3 less than the normal; cloudy, 6, or 3 less than the normal. The approximate per cent of possible sunshine was 72, which was about 15 per cent above the normal.

MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.11 inches, which was 0.04 inch above the normal. The highest reading was 30.39 inches at Sandy Hook and Trenton on the 18th, and the lowest, 29.20 inches at Ridgefield on the 1st.

The mean stage of the Delaware River at Phillipsburg was 3.1 feet, and the highest stage, 10.6 feet on the 2d. At Trenton the mean stage was 2.1 feet, which was 0.8 foot above the normal. The highest stage, 6.0 feet, occurred on the 2d.

Thunderstorms occurred in some portions of the State on the 4th, 5th, 12th, 16th, 17th, 27th, and 28th. Dense fog occurred daily from the 13th to 21st, inclusive, and on the 25th and 26th. Lunar halos were observed on the 25th and 26th, and solar halos on the 8th and 25th. Killing frost occurred in portions of Bergen, Morris, Warren, Somerset, Ocean, Burlington, and Atlantic Counties on the 30th and 31st, while elsewhere in the State light to heavy frost was observed on those dates.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken Ridgefield is Morsemere; Indian Mills is Atsion.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

VOL. XXV. TRENTON, N. J., NOVEMBER, 1920. No. 11

## GENERAL SUMMARY.

The weather of November was generally unpleasant, with a notable frequency of rain and persistence of cloudiness, particularly after the first six days. Commencing the 16th, rain fell in copious amounts, so that streams and ponds received an adequate supply of water to raise their levels somewhat above early winter normals. There was a light fall of snow in extreme northern sections on the 15th, but the amount was considerably below the usual November quantity, and it disappeared in a few hours. The coldest period of the month, from the 12th to 15th, was somewhat more than ten degrees below normal, but thereafter temperature variations were comparatively slight. The number of cloudy days breaks the November record, and the amount of sunshine as shown at stations where recorded was less than half of the possible quantity.

Storm warnings were displayed along the coast on the 2d, 3d, 9th, 11th, 12th, 16th, 17th, 22d, 27th, and 28th.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 40 stations was 43.0°, or normal. The highest temperature was 74° at Bridgeton on the 1st, and the lowest, 11° at Culvers Lake on the 13th. The greatest daily range of temperature was 34° at Tuckerton on the 1st and Indian Mills on the 14th. The highest monthly mean was 47.8° at Cape May City, and the lowest, 38.6° at Layton.

The temperature departure from the normal for the year 1920 to date, by sections, is: The Highlands, -0.8°; Red Sandstone Plain, -0.5°; Southern Interior, -0.6°; Sea Coast, -0.9°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 42 stations, was 4.41 inches, which was 0.96 inch above the normal. The average total snowfall was 0.2 inch, which was 1.5 inches below the normal. The greatest monthly precipitation was 7.90 inches at Long Branch, and the least, 2.14 inches at Trenton. The greatest amount of precipitation in any 24 consecutive hours was 3.78 inches at Long Branch on the 16th-17th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 10, or 2 more than the normal.

The precipitation accumulated departure from the normal for the year 1920 to date, by sections, is: The Highlands, +7.19; Red Sandstone Plain, +3.55; Southern Interior, -0.01; Sea Coast, +0.51.

## WIND.

The prevailing direction was from the northwest, which was normal. The wind movement was approximately 12 miles per hour, or somewhat above the normal. The highest velocity, sustained for 5 consecutive minutes, was 85 miles per hour from the northeast at Long Branch on the 17th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 3 less than the normal; partly cloudy days, 6, or 3 less than the normal; cloudy days, 15, or 6 more than the normal. The approximate per cent of possible sunshine was 44, which was considerably below the normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.13 inches, which was 0.03 inch above the normal. The highest reading was 30.60 inches at Ridgefield on the 29th, and the lowest, 29.27 inches at the same station on the 17th.

The mean stage of the Delaware River at Phillipsburg was 3.9 feet, and the highest stage, 8.4 feet, occurred on the 24th. At Trenton the mean daily stage was 2.6 feet, which was 0.9 foot above the normal. The highest stage was 5.7 feet on the 25th, and the lowest, 1.5 feet on the 13th, 15th, and 16th.

The first killing frosts of autumn occurred in the southern portion of the Highlands on the 4th, and throughout the Red Sandstone Plain, the Southern Interior, and the Coast districts on the 12th and 13th. Fog occurred on the 9th, 21st, and 22d. Thunderstorms occurred in some portions of the State on the 22d and 23d. Sleet was observed in northern sections on the 15th, 16th, and 17th. Solar halos were observed on the 1st and 6th, and lunar halos on the 20th and 25th.

## ERRATA.

October, 1920:—Page 76: Belvidere, mean temperature should read 56.7d instead of 56.2d. South Orange, mean temperature should read 58.7d instead of 58.2d. Vineland, mean temperature should read 61.8b instead of 61.4b. Page 78: Vineland, mean minimum temperature should read 48.4b instead of 48.2b.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for November, 1920.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

Vol. XXV. TRENTON, N. J., DECEMBER, 1920. No. 12.

## GENERAL SUMMARY.

The weather was notable for its almost total absence of typical rigorous winter weather. From the central portion of the State southward there was not enough snow to be noticeable, and but little ice formed over streams and ponds, but in northern counties there were several inches of ice at the close of the month. Except from the 18th to 20th, and from the 25th to 29th, temperatures were mostly normal or considerably above, being about 10° above normal on the 14th and 23d. In comparison with other years, this December has been one of the remarkably warm months, although it was slightly warmer two years ago, as well as in 1911, 1912 and 1913. This warmth was an agreeable contrast to the cold of last December and the record-breaking cold of December 1917. In regard to precipitation, which was practically all rain, December of this year has supplied a larger amount, except in 1914, than in any year since 1902. A fair amount of sunshine and pleasant weather afforded opportunities for out-door occupations, and building operations, and such farm work as plowing and hauling were carried on to the close of the month.

Storm warnings were displayed along the coast on the 5th, 13th, 22d, 23d, 26th, and 27th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 40 stations, was 36.4°, which was 3.4° above the normal. The highest temperature was 69° at Clayton on the 4th, and the lowest, 1° below zero at Culvers Lake on the 29th. The greatest daily range of temperature was 32° at Indians Mills on the 12th and Somerville on the 14th. The highest monthly mean was 40.0° at Cape May City, and the lowest, 1.8° at Layton.

The temperature departure from the normal for the year 1920 to date, by sections, is: The Highlands, -0.5°; Red Sandstone Plain, -0.2°; Southern Interior, -0.3°; Sea Coast. -0.6°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 47 stations, was 5.10 inches, which was 1.34 inches above the normal. The greatest monthly precipitation was 6.63 inches at Little Falls, and the least, 2.86 inches at Camp Dix. The average total snowfall was 1.0 inch, which was 5.3 inches below the normal; this average ranged from 2.7 inches in the Highlands to 0.1 inch on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 2.20 inches at Charlotteburg on the 14th. The average number of days on which 0.01 inch or more of precipitation fell was 8, one less than the normal.

The precipitation accumulated departure from the normal for the year 1920 to date, by sections, is: The Highlands, +8.24; Red Sandstone Plain, +5.26; Southern Interior, +1.09; Sea Coast, +1.86.

## WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement was approximately 13 miles per hour, which was probably near the normal. The highest velocity, sustained for 5 consecutive minutes, was 63 miles per hour from the northwest at Long Branch on the 5th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 11, which was 1 less than the normal; partly cloudy days, 8, or 1 less than the normal; cloudy, 12, or 2 more than the normal. The approximate per cent of possible sunshine was 51, and was somewhat below the normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.10 inches, or normal. The highest reading was 30.60 inches at Cape May City on the 21st, and the lowest, 29.35 inches at Ridgefield and Sandy Hook on the 14th.

The mean stage of the Delaware River at Phillipsburg was 5.9 feet, and the highest, 11.5 feet, on the 3d. At Trenton the mean daily stage was 3.9 feet, which was 2.3 feet above the normal. The highest stage was 6.9 feet on the 3d, and the lowest, 2.4 feet on the 30th.

Dense fog occurred on the 1st, 4th, 22d, 23d, and 27th. Haze was noted on the 4th. Sleet was observed at a few stations on the 9th and 22d, and quite generally throughout the State on the 10th, 26th, and 27th. The amounts were small. Solar halos were observed on the 3d and 19th, and lunar halos on the 21st and 30th. Thunderstorms occurred in some portions of the State on the 1st, 2d, and 14th, and in most portions on the 5th. Some hail was observed in northern counties during the storms of the 1st and 14th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, \*, †, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

G. HAROLD NOYES, Section Director.

TRENTON, N. J.

VOL. XXV. ANNUAL SUMMARY, 1920. No. 13.

### GENERAL SUMMARY.

The year 1920 opened with persistent cold weather over New Jersey, and all the typical features of severe winter weather continued into February. Excepting that March was slightly warmer than normal, the deficiency in warmth continued from the latter part of November, 1919, through July, 1920; thereafter there was a moderate excess of warmth through the close of the year. No conspicuous records were broken, temperatures did not reach 100° during the year, but did reach 25° below zero in February. There were heavy falls of sleet and snow in February with resulting interruption to traffic, and the excessive cold was followed by destruction of improved roads when the frost heaved the ground in the spring. The summer months and December were featured by excessive amounts of rain, and the harvest of grass and grains was reduced. October was a notably dry and very warm month, and produced an agreeable late prolongation of summer. The total precipitation of 1919 and 1920, were both approximately 52 inches, and have not previously been equalled since 1903. Coincident with the moderate excess of precipitation, was a deficiency of clear skies and sunshine, but wind force and direction produced no notable record.

The mean temperature for the year, 51.2°, was 0.3° below the normal. The warmest month was August, 72.3°, and the coldest, January, 23.6°. The highest temperature was 98° at Imlaystown on June 29th, and the lowest, 25° below zero at Culvers Lake on February 1st. The highest mean temperature was 54.5° at Vineland, and the lowest, 47.2° at Charlotteburg. The greatest annual range of temperature was 109° at Layton, being from 93° to -16°.

The average precipitation for the State, for the year, was 51.87 inches, which was 4.15 inches above the normal. The greatest monthly average was 6.18 inches in June, and the least, 1.80 inches in October. The greatest monthly precipitation was 16.25 inches at Newark in July, and the least, 0.55 inch at Bridgeton in October. The greatest annual precipitation was 65.45 inches at Newark, and the least, 42.89 inches at Trenton.

The average snowfall of the State was 35.1 inches, which was 1.5 inches above the normal. The greatest annual snowfall was 69.6 inches at Culvers Lake, and the least, 8.1 inches at Cape May City.

The average number of days on which 0.01 inch or more of precipitation occurred was 127, which was 13 more than the normal. The average number of clear days was 158, which was 17 more than the normal; partly cloudy, 94, which was 23 less than the normal; cloudy, 114, which was 6 more than the normal.

The prevailing wind direction was from the northwest; the highest velocity was 85 miles per hour, sustained for 5 consecutive minutes, from the northeast at Long Branch on November 17th.

Unimportant occurrences of hail were on April 4th, 5th, 11th, 23d, and 24th, May 4th and 21st, June 15th, 22d, and 24th, July 3d, 22d, 23d, 24th, and 31st, and August 21st. Minor damage from hail occurred on June 14th, 16th, and 30th. Considerable damage from hail occurred at Adelphia, Bridgeton, Freehold, Lakewood, and Ridgefield on June 11th; Bridgeton,

Burlington, Cedarville, and Fairton on June 13th; Folsom on June 17th; Mt. Bethel on June 24th; and Elizabeth, Imlaystown, New Brunswick, Newton, and Trenton on June 29th.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

VOL. XXVI. TRENTON, N. J., JANUARY, 1921. No. 1.

### GENERAL SUMMARY.

The general characteristics of January weather were largely absent during the first month of 1921 in New Jersey. The average temperature of the entire State was above freezing, and consequently with little snow and ice. Night temperatures were mostly well below freezing, but the warmth of daytime more than counteracted the freezing, and there were considerable periods with no frost in the ground. This open weather was in marked contrast with that of January, 1920, when one of the most severe winter months prevailed. From the 17th to the 20th, and from the 24th to the 27th the weather was moderately cold, and many streams and nearly all ponds were closed in with ice, but from central districts southward there was too little ice to harvest.

Cold waves occurred on the 18th and 25th, and the principal occurrences of snow were on the 12th, 14th and 31st. Floating ice came down the Delaware River on the 18th, and the river was frozen on the 20th from tidewater upstream, for several days, but the ice was pretty well gone by the close of the month.

An earthquake occurred at 6:40 p. m. of the 26th, in the vicinity of the extreme western portions of Burlington and Camden Counties, and thence about 15 miles to the eastward. The shock was abrupt, and of a trembling nature, and was felt by nearly everyone, and doors and furniture were moved. The quake was probably a sort of sand settling, or shifting, rather than of the percussion of a fault in rending rock structure.

Storm warnings were displayed along the coast on the 10th, 13th, 14th, 16th, 17th, 20th, 30th, and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 33.0°, which was 3.0° above the normal. The highest temperature was 63° at Indian Mills on the 21st, and the lowest, 11° below zero at Culvers Lake on the 5th. The greatest daily range of temperature was 44° at Boonton on the 27th. The highest monthly mean was 36.9° at Vineland, and the lowest, 29.1° at Newton.

The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +3.4°; Red Sandstone Plain, +2.8°; Southern Interior, +2.8°; Sea Coast, +3.2°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 2.63 inches, which was 1.03 inches below the normal. The greatest monthly precipitation was 3.49 inches at Dover, and the least, 1.78 inches at Hamonton. The average total snowfall was 2.7 inches, which was 2 inches below the normal; this average ranged from 5.6 inches at the Highlands to 1.0 inch on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 2.20 inches at South Orange on the 14th. The average number of days on which .01 inch or more of precipitation fell was 9, which was 2 less than the normal.

The precipitation accumulated departure from the normal for the year 1921 to date, by sections, is: The Highlands, -0.68; Red Sandstone Plain, -0.98; Southern Interior, -1.16; Sea Coast, -1.43.

### WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement was approximately 12 miles per hour, which was probably normal. The highest velocity, sustained for 5 consecutive minutes, was 60 miles per hour from the northwest at Long Branch on the 25th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 3 more than the normal; partly cloudy, 8, or 1 less than the normal; cloudy, 10, or 2 less than the normal. The approximate per cent of possible sunshine was 53, which was slightly above the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.17 inches, which was 0.06 inch above the normal. The highest reading was 30.97 inches at Ridgefield and Sandy Hook on the 19th, and the lowest, 29.46 inches at Sandy Hook on the 14th.

The mean stage of the Delaware River at Phillipsburg was 3.2 feet, and the highest, 6.0 feet, on the 15th. At Trenton the mean daily stage was 2.8 feet, which was 0.8 foot below the normal. The highest stage was 6.2 feet on the 20th, and the lowest, 1.8 feet on the 14th.

Thunderstorms occurred over the northeast portion of the State on the 5th. Dense fog occurred on the 5th, 9th, 10th, 15th, 22d, 23d, and 30th. Haze occurred on the 20th and 28th. Sleet was observed quite generally throughout the northern half of the State on the 7th, and at a few stations on the 8th, 14th, 20th, and 31st. Solar halos were observed on the 3d, 11th, and 13th, and lunar halos on the 21st and 25th.

### COMPARATIVE DATA FOR JANUARY.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

VOL. XXVI. TRENTON, N. J., FEBRUARY, 1921. No. 2.

### GENERAL SUMMARY.

From the earliest compilation of State temperature averages in 1885 to the present, there have been but four warmer Februaries than that of 1921, in New Jersey, namely, in 1890, 1891, 1909, and 1915. Normally, the temperature in the northern half of the State would be several degrees below freezing, and in the southern half, several degrees above, but this year temperatures were above freezing in all portions with notable persistence. But a scanty ice crop was harvested in extreme northern portions, and none in the central and southern districts. Frost was in the ground, but only on occasional days, and considerable plowing was done in central and southern portions of the State as opportunity offered. One very generous snow storm occurred on the 20th, and a lesser amount on the 22d, and this snow covering disappeared rapidly at the close of the month. A cold wave followed the snowstorms, and the coldest weather of the month was on the 25th, when temperatures below zero occurred in many sections of northern districts.

The weather was remarkably pleasant and afforded opportunity for many outdoor labors, and these were actively pursued. Streams and lakes were at unusually low levels, but there was a notable increase in them at the close of the month.

Storm warnings were displayed along the coast on the 10th, 11th, 16th, 17th, 19th, 20th, 21st, 23d, 26th, and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 40 stations, was 34.0°, which was 4.4 above the normal. The highest temperature was 71° at Vineland on the 16th, and the lowest, 12° below zero at Culvers Lake on the 25th. The greatest daily range of temperature was 45° at Indian Mills on the 16th. The highest monthly mean was 38.4° at Cape May City, and the lowest, 29.2° at Layton.

The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +3.8°; Red Sandstone Plain, +3.4°; Southern Interior, +3.8°; Sea Coast, +3.8°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 38 stations, was 3.82 inches, which was 0.25 inch above the normal. The greatest monthly precipitation was 5.82 inches at Little Falls, and the lowest, 2.58 inches at Bridgeton. The average total snowfall was 13.6 inches, which was 3.4 inches above the normal: this average depth ranged from 21.0 inches in the Highlands to 6.2 inches on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 2.50 inches at South Orange on the 20th. The average number of days on which 0.01 inch or more of precipitation fell was 10, which was 1 more than the normal.

The precipitation accumulated departure from the normal for the year 1921 to date, by sections, is: The Highlands, -0.61 inch; Red Sandstone Plain, -0.50 inch; Southern Interior, -0.85 inch; Sea Coast, -1.58 inches.

### WIND.

The prevailing wind direction was from the northwest, with an approximate velocity of 12 miles per hour, and was somewhat less than the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 65 miles per hour from the north at Sandy Hook on the 20th. High winds were noted also on the 6th, 10th, 11th, 12th, 14th, 17th, 19th, 24th, and 27th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 10, which was 1 less than the normal; partly cloudy days, 8, or normal; cloudy days, 10, which was 1 more than the normal. The approximate per cent. of possible sunshine was 54, and was somewhat below the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.09 inches, which was 0.01 inch below the normal. The highest reading was 30.60 inches at Cape May City, Ridgefield, and Sandy Hook on the 19th, and the lowest, 29.36 inches at Trenton on the 11th.

The mean stage of the Delaware River at Phillipsburg was 2.5 feet, and the highest stage was 3.9 feet on the 20th. At Trenton the mean daily stage was 1.8 feet, which was 1.7 feet below the normal. The highest stage was 3.1 feet on the 28th, and the lowest, 1.1 feet on the 6th.

Dense fog occurred on the 3d, 5th, 6th, 9th, 10th, 11th, 23d, and 28th. Haze occurred on the 8th. Sleet was observed at a few stations on the 7th, 8th, 19th, and 21st, and quite generally throughout the State on the 9th, 10th, 11th, and 20th. Solar halos were observed on the 1st 3d, 4th, 10th, 21st, 25th, and 26th, and lunar halos on the 13th, 17th, 18th, and 19th.

### COMPARATIVE DATA FOR FEBRUARY.

† On other dates also.

‡ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

VOL. XXVI. TRENTON, N. J., MARCH, 1921. No. 3.

### GENERAL SUMMARY.

The one outstanding feature of the weather conditions during March, 1921, in New Jersey, was the remarkably high temperature which prevailed almost without interruption. Every day was either of normal or in excess of normal warmth, until the 29th and 30th, when a cold wave occurred. Many days were more than twenty degrees warmer than normal, with the result that vegetation made a very early start. Nearly all orchard fruits were in bloom when the cold wave occurred at the close of the month, with the result that there was serious damage. The State mean temperature, 49°, was 1.5° higher than the highest record heretofore; was nearly 20° warmer than the coldest March on record; and was 10° warmer than normal. Moisture, wind and sunshine were relatively normal, except that the wind coming from the southerly quadrant was unusual for March.

The cold wave which swept over the State on the afternoon of the 28th, was attended by a notable drop in temperature, amounting to 55° or more in 18 hours, and for a part of the time was at the rate of 20° in 20 minutes.

A tornado of fairly well developed form swept over a portion of the County of Somerset and city of Somerville, and did considerable material damage, attendant upon the sudden change of the 28th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 39 stations was 49.1°, which was 10.3° above the normal. The highest temperature was 92° at Woodbine on the 27th, and the lowest, 9° at Culvers Lake on the 30th. The highest monthly mean temperature was 55.0° at Vineland, and the lowest, 44.2° at Charlotteburg. The greatest daily range of temperature was 52° at Newark on the 28th. The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +5.8°; Red Sandstone Plain, +5.6°; Southern Interior, +6.4°; Sea Coast, +5.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations was 3.03 inches, which was 0.86 inch below the normal. The mean total snowfall was trace, which was 5.9 inch below the normal. The greatest monthly precipitation was 4.65 inches at Dover, and the least, 1.80 inches at Somerville. The greatest amount of precipitation in any 24 consecutive hours was 1.73 inches at Charlotteburg on the 24th. The mean of the number of days on which 0.01 inch or more of precipitation occurred was 11, which was normal. The precipitation accumulated departure from the normal for the year 1921 to date, by sections, is: The Highlands, -0.85 inch; Red Sandstone Plain, -1.63 inches; Southern Interior, -1.54 inches; Sea Coast, -3.02 inches.

### WIND.

The prevailing wind direction was from the south, with an approximate velocity of 12 miles per hour, which was about normal. The highest wind velocity, sustained for 5 consecutive minutes, was 70 miles per hour from the northwest on the 28th at Long Branch. High winds were also reported on the 9th, and 21st.

### SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 14, which was normal; partly cloudy, 10, which was 2 more than the normal; cloudy, 7, which was 2 less than the normal. The mean percent of possible sunshine approximated 64, and was 5 percent above the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Trenton was 4.9 feet, which was 1.0 foot above the normal; the highest stage was 9.4 feet on the 11th.

The mean atmospheric pressure, reduced to sea level, was 30.17 inches, which was 0.16 inch above the normal. The highest reading was 30.64 inches at Ridgefield on the 23d, and the lowest, 29.67 inches at Trenton on the 9th. Dense fog was reported on the 3d, 7th, 8th, 9th, 12th, 13th, 14th, 15th, 16th, 26th, 27th, 28th, and 31st. Sleet occurred on the 5th, 28th, and 29th, and hail on the 5th and 28th. Solar halos were observed on the 10th, 12th, 14th, 17th, 19th, 22d, 27th, and 28th, and lunar halos on the 15th, 16th, 18th, 20th, 21st, and 25th. Thunderstorms occurred on the 2d, 4th, 8th, 9th, 16th, 19th, 21st, 26th, and 28th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

## Daily Precipitation for March, 1921.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. \*\*\* Regular Weather Bureau station; precipitation is for 24-hour period, midnight to midnight. † Separate dates of falls not recorded.  
 †† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. § Incomplete or missing.  
 \* Precipitation included in the next following measurement. \*\*Precipitation for 24-hour period from midnight to midnight. T. Trace, or less than 0.01 inch.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

VOL. XXVI. TRENTON, N. J., APRIL, 1921. No. 4.

### GENERAL SUMMARY.

A cold wave at the close of March extended over into April, and the lowest temperature of the month in New Jersey occurred on the 2d. Thereafter the warmth was continuously above normal, except for brief subnormal periods from the 10th to the 12th, and on the 18th-19th, so that April, 1921 averaged the warmest on record. This warmth has been remarkable for its persistence. It has averaged nearly 6° above normal from December to April, inclusive. The early warming of the ground greatly advanced vegetation and farm work, but frosty weather on the 10th, 12th, and 20th proved disastrous to tender growth. The temperature departures above normal were considerably less along the shore than in the interior, and the precipitation departures varied irregularly from above to below normal. There were no other outstanding features of the weather of the month. Storm warnings were displayed along the coast on the 14th, 17th, and 22d.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations was 56.3°, which was 6.8° above the normal. The highest temperature was 87° at Moorestown on the 25th, and the lowest, 15° at Culvers Lake on the 2d. The highest monthly mean temperature was 59.1° at Burlington, and the lowest, 53.2° at Charlotteburg. The greatest daily range of temperature was 45° at Charlotteburg on the 14th. The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +6.1°; Red Sandstone Plain, +6.0°; Southern Interior, +6.5°; Sea Coast, +5.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations was 3.57 inches, which was 0.11 inch below the normal. The mean total snowfall was 0.4 inch, which was 0.4 inch below the normal. The greatest monthly precipitation was 5.20 inches at Long Branch, and the least, 1.86 inches at Trenton. The greatest amount of precipitation in any 24 consecutive hours was 2.10 inches at Camp Dix on the 23d-24th, the mean number of days on which 0.01 inch or more of precipitation occurred was 11, which was 1 more than the normal. The precipitation accumulated departure from the normal for the year 1921 to date, by sections, is: The Highlands, +0.63 inch; Red Sandstone Plain, -1.95 inches; Southern Interior, -1.43 inches; Sea Coast, -3.34 inches.

### WIND.

The prevailing direction was from the southwest, with an approximate velocity of 11 miles per hour, which was about nor-

mal. The highest wind velocity, sustained for 5 consecutive minutes, was 66 miles per hour from the southeast on the 23d at Long Branch. High winds were reported also on the 1st and 17th.

### SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 13, which was 2 more than the normal, partly cloudy, 6, which was 4 less than the normal; cloudy, 11, which was 2 more than the normal. The approximate per cent. of possible sunshine was 54, which was about normal.

### MISCELLANEOUS.

The mean daily stage of the Delaware River at Trenton was 3.2 feet, which was 0.6 foot below the normal; the highest stage was 4.5 feet on the 25th.

The mean atmospheric pressure, reduced to sea level, was 30.06 inches, which was 0.06 inch above the normal. The highest reading, 30.54 inches, occurred at Ridgefield on the 7th, and the lowest, 29.54 inches, at Trenton on the 23d.

Dense fog was reported on the 5th, 6th, 7th, 8th, 9th, 15th, 16th, 23d, and 29th. Sleet occurred at some stations on the 1st and 18th, but in no appreciable amounts. Solar halos were observed on the 14th and 25th, and a lunar halo on the 12th. Thunderstorms occurred on the 9th, 17th, 23d, and 30th. Killing frosts occurred quite generally on the 2d and 12th, and at a few scattered stations on the 20th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

\* Occurred on March 31-April 1, and published in March report.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for April, 1921.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

VOL. XXVI. TRENTON, N. J., MAY, 1921. No. 5.

### GENERAL SUMMARY.

Weather conditions during May were approximately normal in nearly all elements. The distribution of warmth above and below normal was of fair equality, and without approach to extremes of previous records. The coolest portions of the State were along the coast, and in the extreme northern counties, and in the latter frosts occurred as late as the 17th. The amount of rainfall was approximately normal, but nearly all of it occurred during the first half of the month, and the heaviest quantities were over the northeastern counties, remote from the general agricultural areas. This resulted in adverse conditions for crop growth, and was particularly accentuated by dry, northeasterly winds, a noticeably unusual weather condition. Low temperatures at night were a further unfavorable factor for crop growth. General outdoor pursuits were favored to a considerable extent by the dry weather, and farm work was somewhat ahead of the season. Although there has been an accumulating deficiency in precipitation during the year 1921 to date, there appears to be no lack of supply of ground waters as shown by lakes and streams.

Storm warnings were displayed along the coast on the 1st, 3d, 4th, 5th, and 23d.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 70.2°, which was 0.2° below the normal. The highest temperature was 96° at Woodbine on the 22d, and the lowest, 30° at Culvers Lake on the 17th. The highest monthly mean temperature was 62.9° at Little Falls, and the lowest, 57.2° at Charlotteburg. The greatest daily range of temperature was 45° at Indian Mills on the 18th and at Layton on the 21st.

The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +4.9°; Red Sandstone Plain, +4.9°; Southern Interior, +5.0°; Sea Coast, +4.4°.

### PRECIPITATION.

The average total precipitation of the State, as deduced from observations of 42 stations, was 4.17 inches, which was 0.21 inch above the normal. The greatest monthly amount was 6.44 inches at New Brunswick, and the least, 2.60 inches at Indian Mills. The greatest amount accumulated in any 24 consecutive hours was 2.48 inches at New Brunswick on the 5th. The average number of days on which .01 inch or more of rain fell was 10, which was one less than the normal. There was a trace of snow at Culvers Lake on the 5th.

The accumulated precipitation departure from the normal for the year 1921 to date, by sections is: The Highlands, -0.90 inch; Red Sandstone Plain, -1.04 inches; Southern Interior, -1.72 inches; Sea Coast, -3.08 inches.

### WIND.

The prevailing wind direction was from the northeast, with

an approximate velocity of 11 miles per hour, which was about normal. The highest velocity, sustained for 5 consecutive minutes, was 72 miles per hour from the northeast at Long Branch on the 5th. High winds were noted also on the 9th, 23d, and 29th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 2 more than the normal; partly cloudy, 7, or 3 less than the normal; cloudy, 10, or one more than the normal. The approximate per cent. of possible sunshine was 56, and was somewhat below the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was 0.07 inch above the normal. The highest reading was 30.45 inches at Ridgefield and Sandy Hook on the 20th, and the lowest, 29.60 inches at Atlantic City on the 4th.

The mean stage of the Delaware River at Trenton was 2.6 feet, which was 0.1 foot below the normal; the highest stage was 4.7 feet on the 5th.

Killing frost was noted at Culvers Lake on the 17th, and light frosts occurred at Dover on the 2d, and at Highwood, Layton, and Newton on the 17th. Thunderstorms occurred in some portions of the State on the 5th, 13th, 15th, 16th, 22d, 23d, 28th, and 29th. Solar halos were observed on the 3d, 11th, 12th, 15th, 16th, 21st, and 24th, and lunar halos on the 15th and 16th. Fog was noted on the 13th, 15th, and 20th; smoke on the 9th; and light haze on the 10th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, and 22d.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

## Daily Precipitation for May, 1921.

AUG 16 1921

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

VOL. XXVI. TRENTON, N. J., JUNE, 1921. No. 6.

### GENERAL SUMMARY.

The tendency of the earlier months of 1921 towards an excess of warmth has been continued during June in New Jersey to a moderate degree, and although the temperature departure above normal was slight, it has not been exceeded in heat since 1899, but was equalled in 1900 and 1906. This warmth taken in connection with a persistent, but slight, deficiency in precipitation since the first of the year, caused drought conditions to become acute over many portions of the State, particularly eastern and southern regions and in the forested areas. The very notably warm March and April followed by unfavorable weather for crop growth in May, and the June drought, have been a serious detriment to substantial advancement of vegetation. Forest fire conditions became serious, and the State Firewarden promulgated orders forbidding the kindling of camp and similar fires within his jurisdiction. The absence of consecutive rainy days afforded one of the best haying seasons in many years, and the crop was housed in most cases unusually early. All forms of outdoor pursuits were greatly favored by the weather.

A violent thunderstorm passed over the State from Trenton eastward on the 27th, with hailstorms three-fourths inch in diameter; there was much damage to trees by the wind, and many small fires started from lightning. Another severe storm passed over central portions of the State on the 29th, with much attending damage of a minor character from lightning and wind. One death from lightning occurred in Burlington.

The continued lack of rain has maintained water courses at a low stage.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 36 stations, was 70.4°, which was 1.8° above the normal. The highest temperature was 100° at Paterson on the 22d, and the lowest was 33° at Charlotteburg on the 2d. The highest monthly mean temperature was 73.2° at Bridgeport, Moorestown and Vineland, and the lowest, 66.2° at Charlotteburg. The greatest daily range of temperature was 47° at Indian Mills and Lakewood on the 3d. The temperature departure from the normal for the year 1921, to date, by sections is: The Highlands, +4.4°; Red Sandstone Plain, +4.4°; Southern Interior, +4.4°; Sea Coast, +3.9°.

### PRECIPITATION.

The average total rainfall for the State, as deduced from observations of 40 stations, was 3.23 inches, which was 0.30 inch below the normal. The greatest monthly amount was 5.64 inches at Plainfield, and the least, 1.40 inches at Northfield. The greatest amount of rain in 24 consecutive hours was 3.26 inches at Trenton on the 27th and 28th. The average number of days on which 0.01 inch or more rain fell was 8, which was 1 less than the normal.

The precipitation accumulated departure from the normal for the year 1921, to date, is: The Highlands, -0.80 inch; Red Sandstone Plain, -0.73 inch; Southern Interior, -2.34 inches; the Sea Coast, -3.80 inches.

### WIND.

The prevailing wind direction for the month was from the southwest, with an approximate velocity of 10 miles per hour, which was slightly above the normal. The highest velocity for the month, sustained for five consecutive minutes, was 62 miles per hour from the northwest on the 28th at Long Branch. High winds were also noted on the 14th, 15th, 27th and 28th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, which was 6 more than the normal; partly cloudy, 7, which was 4 less than the normal; cloudy, 5, which was 2 less than the normal. The approximate percentage of possible sunshine was 68, probably somewhat above the normal value.

### MISCELLANEOUS.

The mean stage of the Delaware River at Trenton was 0.8 feet, which was 1.4 feet below the normal; The highest stage was 1.4 feet on the 1st and 4th.

The mean atmospheric pressure, reduced to sea level, was 29.98 inches, which was normal. The highest reading was 30.31 inches at Sandy Hook on the 2d, and the lowest, 29.57 inches at Ridgefield and Sandy Hook on the 13th. Thunderstorms occurred in some portions of the State on the 3d, 4th, 11th, 13th, 17th, 21st, 22d, 23d, 24th, 26th, 27th, 28th, 29th and 30th. Solar halos were observed on the 6th and 16th and lunar halos on the 24th. Fog was observed on the 10th, 24th, 27th, 28th and 30th. Light frost occurred at Lakewood on the 3d, and New Lisbon on the 5th, and heavy frost at New Lisbon on the 3d. Hail did little damage at Newton and Trenton on the 27th, at Dover on the 28th and Belvidere on the 29th, and much damage at Burlington on the 27th.

† On other dates also.

‡ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, \*, b, °, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for June, 1921.

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

STANLEY S. SCHWORM, Meteorologist,  
Temporarily in Charge.

VOL. XXVI. TRENTON, N. J., JULY, 1921. No. 7.

## GENERAL SUMMARY.

The month was very warm, with high humidity and violent local thunderstorms. While the monthly maxima were slightly below the July average, the daily plus departures were so consistently maintained throughout the month that, with the exception of the years 1887 and 1901, it was the warmest July in New Jersey in 37 years. There was some temporary and scattered relief from the oppressiveness during the period from the 10th to 20th, when showers and nearly normal temperatures prevailed. There was a deficiency of practically one inch in the rainfall throughout the State, only nine stations reporting an excess for the month. Heavy local thunderstorms occurred on the 19th, 26th, and 31st. The storm during the evening of the 19th was the most violent experienced in many years in the north-central districts. It was of comparatively short duration, but the area covered comprised portions of Hunterdon, Somerset, Mercer, Middlesex, and Monmouth Counties. It was attended by torrential rains; Flemington reporting 4.48 inches in five hours. For a few hours flood conditions prevailed along the Raritan River, which rose as much as ten feet in many places, but rapidly receded the following morning. Much damage to crops was caused by the overflowing, and many mills along the stream were forced to close; while on the Neshanic, a tributary, covered bridges at South Clover Hill and West's Mill were washed away. High winds and severe lightning caused considerable damage throughout the area to buildings and crops. Many barns and several churches were struck and burned, while a man was burned to death near Hopewell when his barn was set afire by lightning. A peculiar wind storm occurred at South Eatontown during the forenoon of the 19th, when a house and outbuildings were wrecked and several trees measuring three feet across were uprooted. There was no damage elsewhere on the farm, and the storm lasted but thirty seconds. It started about five hundred yards to the southwest of the house and ended a short distance beyond it.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 76.5°, which was 2.8° above the normal. The highest temperature was 99° at Vineland on the 4th, and the lowest, 43° at Charlotteburg on the 23d. The highest monthly mean temperature was 79.4° at Bridgeton and Vineland, and the lowest, 72.6° at Charlotteburg. The greatest daily range of temperature was 38° at Charlotteburg on the 23d. The temperature departure for the year 1921 to date, by sections, is: The Highlands, +4.2°; Red Sandstone Plain, +4.2°; Southern Interior, +4.2°; Sea Coast, +3.6°.

## PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 41 stations was 3.62 inches, which was 0.99 inch below the normal. The greatest monthly rainfall was 7.36 inches at New Brunswick, and the least, 1.66 inches at Paterson. The greatest amount of rain in any 24 consecutive hours was 4.91 inches at New Brunswick on the 20th. The mean of the number of days on which 0.01 inch or more of rain fell was 10, or normal. The precipitation accumulated departure from the normal

for the year 1921 to date, by sections, is: The Highlands, -1.66 inches; Red Sandstone Plain, -1.97 inches; Southern Interior, -3.98 inches; Sea Coast, -3.66 inches.

## WIND.

The prevailing wind direction was from the southwest, with an approximate velocity of 8 miles per hour, which was somewhat below the normal. The highest velocity, sustained for 5 consecutive minutes, was 52 miles per hour from the south on the 19th at Sandy Hook.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 2 more than the normal; partly cloudy, 9, or 3 less than the normal; cloudy, 8, or 1 more than the normal. The approximate percentage of possible sunshine was 62, which was about normal.

## MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.4 feet, and highest stage, 4.7 feet on the 20th. At Trenton the mean stage was 1.2 feet, which was normal. The highest stage, 4.2 feet, occurred on the 20th.

Thunderstorms occurred in some portions of the State on the 1st, 2d, 9th, 10th, 14th, 15th, 17th, 19th, 20th, 25th, 26th, 28th, 29th, 30th, and 31st. Dense fog was observed on the 7th, 10th, 11th, 12th, 13th, 18th, 22d, 25th, and 31st. Haze and smoke were noted daily from the 3d to 9th. Solar halos were observed on the 1st, 9th, and 27th. Hail occurred as follows: 26th, slight damage at Somerville; severe damage at Waterford; 31st, few stones at Plainfield and Trenton; minor damage at Asbury Park, Hightstown, Highwood, Paterson (near), Ridgefield, and Sussex.

## COMPARATIVE DATA FOR JULY.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

STANLEY S. SCHWORM, Meteorologist,  
Temporarily in Charge.

VOL. XXVI. TRENTON, N. J., AUGUST, 1921. No. 8.

### GENERAL SUMMARY.

August rainfall in New Jersey was in marked contrast in the year 1921 with that of 1920, in that there was much less in amount and frequency in 1921. While the total was nearly a normal quantity, it occurred principally on the 2d-3d, and 7th-8th, and in the latter half of the month there was very little, so that agriculture was experiencing a moderate drought. Other rainy days were the 14th and 17th-18th, and in the southern half of the State, on the 21st, 29th, and 31st. In nearly all portions of the State the rain was very heavy on the afternoon and evening of the 7th, extending into the 8th. Amounts exceeding 2 inches in about ten hours were frequent; at Burlington the rainfall was over 4 inches, and at Trenton 5.30 inches fell in nine hours and nine minutes. During this storm at Trenton, there were two occurrences in 35-minute periods of 1.05 inches and 1.51 inches; the greatest 30-minute record was 1.43 inches. This vast quantity of water, accumulating so rapidly, far exceeded all known records for central New Jersey, and local flooding with consequent damage resulted very generally.

Moderately cool weather prevailed with remarkable persistence during the month; there were but six or seven days that appreciably exceeded normal warmth, the other days being very agreeably cool. There have been but three cooler Augusts since 1885, viz. in 1886, 1889, and in 1903. In 1919 there was very little difference in temperature, being one tenth degree warmer than in 1921.

More than the usual amount of clear sky prevailed, making the month particularly favorable for out-door activities. The oppressiveness of excessive humidity was appreciably less than is ordinarily the case in August.

No storm warnings were displayed during the month.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 69.8°, which was 2.3° below normal. The highest temperature was 97° at Elizabeth on the 30th, and the lowest, 38°, at Charlotteburg on the 23d. The highest monthly mean temperature was 72.5° at Vineland, and the lowest, 64.9° at Charlotteburg. The greatest daily range of temperature was 40° at Charlotteburg and Little Falls on the 23d and 30th, respectively.

The temperature departure from normal for the year 1921 to date, by sections, is: The Highlands, +3.4°; Red Sandstone Plain, +3.4°; Southern Interior, +3.4°; Sea Coast, +3.0.

### PRECIPITATION.

The average total rainfall of the State, as deduced from observations of 42 stations, was 4.32 inches, which was 0.45 inch below normal. The greatest monthly amount was 8.01 inches at Trenton, and the least, 2.05 inches at Culvers Lake. The greatest amount accumulated in any 24 consecutive hours was 5.30 inches at Trenton, on the 7th-8th. The average number of days on which .01 inch or more rain fell was 9, which was 1 less than normal. The greatest frequency of rainy days was 12, and the least 6.

The accumulated precipitation departure from normal for the year 1921 to date, by sections is: The Highlands, -2.90 inches;

Red Sandstone Plain, -2.63 inches; Southern Interior, -3.82 inches; Sea Coast, -4.99 inches.

### WIND.

The prevailing wind movement was from the southwest, with an approximate velocity of 9 miles per hour, which was about normal. The highest velocity, sustained for 5 consecutive minutes, was 42 miles per hour from the south, at Long Branch on the 17th. There was a notable absence of wind squalls attendant upon the few thunderstorms that occurred.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, which was 5 more than normal; partly cloudy, 7, or 4 fewer than normal; cloudy, 6, or 1 less than normal. The percentage of possible sunshine approximated 65, which was slightly more than normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.09 inches, which was 0.09 inch above normal. Pressure readings ranged from 30.33 inches to 29.65 inches.

The mean stage of the Delaware River at Phillipsburg was 1.1 feet; the highest stage being 2.0 feet on the 4th. At Trenton, the mean daily stage was 0.8 foot, which was 0.2 foot below normal. The highest stage was 1.8 feet on the 1st.

Light hail occurred near Highwood on the 7th, without damage.

Thunderstorms occurred in some portions of the State on the 2d, 6th, 7th, 8th, 13th, 14th, 17th, 18th, 20th, 21st, 30th and 31st.

Dense fog occurred in various localities from the 10th to 15th, on the 20th, 24th, 25th 29th and 30th.

### COMPARATIVE DATA FOR AUGUST.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, \*, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for August, 1921.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVI. TRENTON, N. J., SEPTEMBER, 1921. No. 9.

### GENERAL SUMMARY.

The outstanding features of weather conditions in New Jersey during the month of September 1921 were the days of consecutive excess of warmth and the deficiency of rain. There were but two days subnormal in temperature, while many were from ten to twelve or more degrees warmer than normal, so that the month, as a whole, throughout the State, averaged the warmest on record since compilations were first made in 1885. In fact, the month was warmer than the preceding month of August.

The rainfall was fairly regular of occurrence but amounts were deficient, except over Sussex County where a slight excess of water fell. The southern half of the State, except in the southern portion of Gloucester County, was notably dry, and the agricultural situation became somewhat adversely affected.

No frosts were reported in any portion of the State, which is another unusual feature for September, particularly in the northern highlands.

There was a severe storm in the northern counties on the 3d, and on the 30th a short storm of marked force swept over the State doing considerable damage to insecure objects.

Storm warnings were displayed along shore on the 21st, 25th, and 30th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 70.2°, which was 4.5° above the normal. The highest temperature was 99° at Bridgeton on the 2d, and the lowest 36° at Charlotteburg on the 27th. The highest monthly mean temperature was 73.4° at Vineland, and the lowest, 65.7° at Charlotteburg. The greatest daily range of temperature was 41° at Charlotteburg on the 9th.

The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +3.5°; Red Sandstone Plain, +3.5°; Southern Interior, +3.5°; Sea Coast, +3.0°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 43 stations, was 2.35 inches, which was 1.26 inches below the normal. The greatest monthly rainfall was 5.04 inches at Sussex, and the least, 0.80 inch at Cape May City. The greatest amount of rain in any 24 consecutive hours was 2.01 inches at Newton on the 7th. The mean of the number of days on which 0.01 inch or more of rain fell was 8, or normal.

The precipitation departure from the normal for the year 1921 to date, by sections, is: The Highlands, -2.90 inches; Red Sandstone Plain, -4.14 inches; Southern Interior, -5.29 inches; Sea Coast, -6.72 inches.

### WIND.

The prevailing wind direction was from the southwest, with an approximate velocity of 9 miles per hour, which was about

the normal. The highest velocity, sustained for five consecutive minutes was 63 miles per hour from the northwest on the 30th at Long Branch. There were high winds also on the 3d and 21st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was 1 more than the normal; partly cloudy, 8, or 1 less than the normal; cloudy, 7, or normal. The approximate percentage of possible sunshine was 61, which was probably somewhat below the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.04 inches, which was 0.03 inch below the normal. The highest reading was 30.31 inches at Sandy Hook on the 20th, and the lowest, 29.60 inches at Ridgefield and Trenton on the 30th.

The mean stage of the Delaware River at Phillipsburg was 0.5 foot, and the highest, 1.5 feet on the 23d. At Trenton the mean stage was 0.4 foot, which was 0.7 foot below the normal. The highest stage, 1.2 feet, occurred on the 25th.

Thunderstorms occurred in some portions of the State on the 2d, 3d, 4th, 6th, 7th, 11th, 12th, 17th, 21st, 22d, 25th, 27th, 28th, 29th, and 30th. Dense fog occurred on the 1st, 2d, 12th, 13th, 27th, and 29th. A solar halo was observed on the 14th, and lunar halos on the 19th and 29th. The aurora was noted on the 28th and 29th. Hail did some damage at Dover on the 3d. No frost formed in the State during the month.

† On other dates also.

‡ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for September, 1921.

# CLIMATOLOGICAL DATA.

DEC 1 1921

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVI. TRENTON, N. J., OCTOBER, 1921. No. 10.

### GENERAL SUMMARY.

The fine autumn weather usually to be attributed to October prevailed during the month, and in some respects it was one of the most delightful months for out-of-door enjoyment of which there is record. In portions of southwestern counties, the warmth was a little above normal, but slightly subnormal elsewhere. The fall of rain was uniformly light and infrequent of occurrence. Records from 1885 to date show but one drier month of October and that was in 1892. The driest portion of the State was that section across the middle from westerly to easterly, and at no station was the rain within an inch and a half of normal. Periods of cool and warm weather alternated with consistent regularity. The lowest temperature readings occurred on the 27th, when it was below freezing in nearly all portions of the State, except along the lower reaches of the Delaware River and the Sea Coast, and in many instances was the lowest October reading known in New Jersey.

The steady deficiency of rain caused a notable lack of water in streams and ponds, and transportation of water was necessary on some farms. In spite of the drought, fall grains made a very satisfactory start, with good germination and root growth.

Storm warnings were displayed along the coast on the 5th, 7th, 8th, 10th, and 22d.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 36 stations, was 54.1°, which was 0.9° below the normal. The highest temperature was 82° at Tuckerton on the 2d, and the lowest, 16°, at Charlotteburg on the 27th. The highest monthly mean temperature was 58.3° at Cape May City, and the lowest, 51.0° at Charlotteburg and Layton. The greatest daily range of temperature was 46° at Camp Dix and Charlotteburg on the 6th.

The temperature departure from the normal for the year 1921, to date, by sections is: The Highlands, +3.1°; Red Sandstone Plain, +3.0°; Southern Interior, +3.1°; Sea Coast, +2.6°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 42 stations, was 0.97 inch, which was 2.76 inches below the normal. The greatest monthly rainfall was 2.18 inches at Culvers Lake, and the least, 0.33 inch at Long Branch. The greatest amount of rain in any 24 consecutive hours was 1.31 inches at Culvers Lake on the 20th. The mean of the number of days on which 0.01 inch or more of rain fell was 5, or 3 less than the normal. A trace of snow fell at Culvers Lake on the 12th.

The precipitation accumulated departure from the normal for the year 1921 to date, by sections, is: The Highlands, -5.03 inches; Red Sandstone Plain, -7.97 inches; Sea Coast, -9.39 inches.

### WIND.

The prevailing direction was from the southwest, with an approximate velocity of 11 miles per hour, which was somewhat above the normal. The highest velocity, sustained for 5 con-

secutive minutes, was 50 miles per hour from the south at Sandy Hook on the 10th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, or 4 more than the normal; partly cloudy, 7, or 1 less than the normal; cloudy, 6, or 3 less than the normal. The approximate per cent of possible sunshine was 71, which was about 10 per cent above the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.02 inches, which was 0.05 inch below the normal. The highest reading was 30.57 inches at Cape May City on the 4th, and the lowest, 29.41 inches at Sandy Hook on the 20th.

The mean stage of the Delaware River at Phillipsburg was 0.9 feet, and the highest stage, 1.5 feet on the 25th. At Trenton the mean stage was 0.6 foot, which was 0.7 foot below the normal. The highest stage, 1.3 feet, occurred on the 24th.

Thunderstorms occurred in some portions of the State on the 12th, 19th, and 20th. Dense fog occurred on the 3d, 15th, 18th, 28th, 29th, 30th, and 31st. A lunar halo was observed on the 15th, and solar halos were observed on the 2d, 7th, 10th, 15th, 18th, and 28th. A few hailstones fell at Trenton on the 12th, and at Bridgeton and Chatham on the 20th. Killing frost occurred in all portions of the State, excepting along the coast, on the 26th and 27th, and at a few stations in central and northern districts as early as the 9th and 14th.

### ERRATA.

August, 1921:—Page 30: Paterson, mean temperature should read 70.9° instead of 72.2°, and the departure -2.6° instead of -1.3°.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for October, 1921.

CHARLES F. MARVIN, Chief.

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVI. TRENTON, N. J., NOVEMBER, 1921. No. 11.

## GENERAL SUMMARY.

There is a normal tendency toward a reaction from the pleasant conditions of autumn weather to more unpleasant occurrences of driving rain, cloudiness and the general forerunner indications of winter, during the latter half of November in New Jersey. Such was the record for 1921. Warmth, quantity and frequency of rain, and cloudiness, were slightly in excess of normal, although these variations were not great. The rain was practically the same as in November of last year. There has been no warmer November since 1912 and 1913, both of which exceeded this year to a considerable extent.

Over the northern highlands and the middle-southeastern coast there was a notable excess of rain, but it was correspondingly dry across the central portion of the State. The amount of snowfall was hardly worth mentioning.

Storm warnings were displayed along the coast on the 4th, 7th, 8th, 10th, and 22d.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 37 stations was 44.3°, which was 1.2° above the normal. The highest temperature was 79° at Camp Dix, Hightstown, and Moorestown on the 18th, and the lowest, 18°, at Indian Mills on the 6th and Charlotteburg on the 11th and 26th. The greatest daily range of temperature was 34°, and occurred at several stations on various dates. The highest monthly mean was 49.3° at Cape May City, and the lowest, 40.6° at Layton. The temperature departure from the normal for the year 1921 to date, by sections, is: The Highlands, +2.9°; Red Sandstone Plain, +2.9°; Southern Interior, +3.0°; Sea Coast, +2.5°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations, was 4.26 inches, which was 1.17 inches above the normal. The average total snowfall was 0.1 inch, which was 1.6 inches below the normal. The greatest monthly precipitation was 6.69 inches at Atlantic City, and the least, 2.79 inches at Long Branch. The greatest amount of precipitation in any 24 consecutive hours was 2.04 inches at Atlantic City on the 29th. The mean of the number of days on which .01 inch or more of precipitation fell was 14, or 6 more than the normal.

The precipitation accumulated departure from the normal for the year 1921 to date, by sections, is: The Highlands, -3.18 inches; Red Sandstone Plain, -6.33 inches; Southern Interior, -6.66 inches; Sea Coast, -8.77 inches.

## WIND.

The prevailing direction was from the northeast. The wind movement was 12 miles per hour, which was one mile below the normal. The highest velocity, sustained for 5 consecutive

minutes, was 63 miles per hour from the northeast at Long Branch on the 28th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 3 less than the normal; partly cloudy, 6, or 3 less than the normal; cloudy, 15, or 6 more than the normal. The per cent of possible sunshine was 42, which was 16 per cent below the normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.07 inches, which was 0.03 inch below the normal. The highest reading was 30.50 inches at Ridgefield and Trenton on the 8th, and the lowest, 29.51 inches at Trenton on the 1st.

The mean stage of the Delaware River at Phillipsburg was 3.3 feet, and the highest stage, 16.4 feet on the 29th. At Trenton the mean daily stage was 1.7 feet, which was normal. The highest stage was 9.9 feet on the 30th, and the lowest, 0.4 foot on the 1st and 3d.

The first killing frosts of autumn did not occur along the coast until the 6th and in some portions on the 13th, except in the extreme southern portion of Cape May County where freezing weather has not yet occurred. Sleet in light amounts was observed in northern sections on the 23d and 24th. Dense fog occurred on the 2d, 17th, 18th, 19th, 24th, 26th, and 27th. Thunderstorms occurred in some portions of the State on the 1st, 2d, and 8th. Solar halos were observed on the 4th, 6th, 11th, and 25th, and lunar halos on the 8th, 11th and 25th. The aurora was observed on the 6th and 8th. Hail fell at Atlantic City on the 2d,

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for November, 1921.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVI. TRENTON, N. J., DECEMBER, 1921. No. 12.

### GENERAL SUMMARY.

The weather of December was approximately normal in all its elements, except in the total precipitation, which was somewhat deficient. Alternating changes from above normal to subnormal warmth every few days, accompanied by similar frequent variations in sunshine and cloudiness, afforded the customary lack of uniformity which ordinarily marks the commencement of winter in this region. From the middle of the month to the close, except on the 17th and 18th, the temperatures averaged mostly below freezing, and nearly all ponds closed over with ice. Streams were nearly all frozen by the cold wave of the 22d, and navigation of the Delaware closed above Bristol, except for a short period on the 27th-28th, when the river was again open up to Trenton.

The snowstorm of the 4th was one of the heaviest on record in early December, especially over the central and southwestern counties where the greatest depths occurred.

The year closed with an unusual excess of warmth accumulated, amounting to somewhat over two degrees per day. The year's precipitation shows an accumulated deficiency ranging from four to ten inches, which is in striking contrast to an excess of from one to eight inches in the year 1920.

Storm warnings were displayed along the coast on the 2d, 4th, 17th, 21st, 29th, and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 32.3°, which is 0.5° below the normal. The highest temperature was 64° at Vineland on the 1st, and the lowest, 9° below zero at Culvers Lake on the 22d. The greatest daily range of temperature was 40° at Little Falls on the 18th and Charlotteburg on the 31st. The highest monthly mean was 36.8° at Cape May City, and the lowest, 28.4° at Layton.

The temperature departure from the normal for the year 1921, by sections, is: The Highlands, +2.7°; Red Sandstone Plain, +2.6°; Southern Interior, +2.7°; Sea Coast, +2.2°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 2.37 inches, which is 1.62 inches below the normal. The greatest monthly precipitation was 3.23 inches at Dover, and the least, 1.62 inches, at Bergen Point. The average total snowfall was 6.2 inches, which was 0.1 inch below the normal; this average ranged from 7.1 inches over the Red Sandstone Plain to 4.5 inches on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 1.04 inches at Culvers Lake on the 3d. The average number of days on which 0.01 inch or more of precipitation fell was 9, or normal.

The precipitation accumulated departure from the normal for the year 1921, by sections, is: The Highlands, -4.57 inches; Red Sandstone Plain, -7.93 inches; Southern Interior, -8.35 inches; Sea Coast, -10.60 inches.

### WIND.

The prevailing wind direction was from the northwest, which

was normal. The wind movement was 12 miles per hour, which was two miles below the normal. The highest velocity, sustained for 5 consecutive minutes, was 70 miles per hour from the northwest at Long Branch on the 21st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than the normal; partly cloudy, 8, which was 1 less than the normal; cloudy, 10, or normal. The per cent of possible sunshine was 54, which was 2 per cent above the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 4.1 feet, and the highest, 10.0 feet on the 1st. At Trenton the mean daily stage was 2.7 feet, which was 0.4 foot below the normal. The highest stage was 6.9 feet on the 1st, and the lowest, 1.4 feet on the 17th, 18th, and 24th.

Dense fog occurred on the 2d, 23d, and 24th. Haze was noted on the 20th. Sleet was observed at several stations in northern districts on the 21st, 23d, 24th, 25th, 29th, and 31st. The amounts were small. Solar halos were observed on the 5th, 13th, 14th, and 19th, and lunar halos on the 8th, 10th, 11th, 12th, 14th, and 19th. A thunderstorm occurred at Bergen Point on the 18th. The first killing frost of autumn occurred at Cape May City on the 5th.

### NOTE.

A change of anemometer exposure at the Atlantic City station was made on December 17, 1921, from the Weather Bureau roof to Absecon Lighthouse; from 48 feet to 172 feet above ground. Comparative readings indicate an increase in wind movement at the new exposure of about 120 per cent. The change was made because of recent construction of high buildings in the neighborhood of the Weather Bureau Building, which greatly obstructed air movement at the lower level.

### COMPARATIVE DATA FOR DECEMBER.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; New Milford and Woodcliff Lake are Weehawken Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for December, 1921.

VOL. XXV.

ANNUAL SUMMARY, 1921.

No. 13.

## GENERAL SUMMARY.

The first four months of the year 1921 were remarkable for their abnormally high temperature, the remainder of the year developed about the usual amount of irregularity in warmth, but the tendency to abnormal warmth persisted. The distribution of temperature differences and quantity of snow conformed very regularly to the geographic position of the State, and the deficiency of snow corresponded logically with the excess of warmth. The years 1913 and 1921 have been the warmest on record in New Jersey, and this warm year of 1921 has been a remarkable feature of a large portion of North America.

The precipitation has been persistently deficient; it was one of the five driest years of record. Other dry years, however, have usually been subnormal in temperature, one, in 1904, being the lowest, and this contrasts markedly with 1921, which was both warm and dry. The record breaking year for precipitation, 1889, was a little above normal in warmth.

January, February and March were singularly unlike the usual winter weather of this region. Only in extreme northern counties were streams and ponds ice-bound, and sleighing conditions hardly occurred. In central and southern counties the harvest of ice was almost negligible. Other months of the year produced no such abnormal features, except the deficient rainfall of October, which averaged less than an inch.

The distribution of precipitation over the State was fairly equal, except in the extreme southern portions, where the yearly total was about thirty inches.

The mean temperature for the year, 54.1°, was 2.6° above the normal. The warmest month was July, 76.5°, and the coldest, December, 32.3°. The highest temperature was 100° at Waterson on June 22d, and the lowest, 12° below zero at Culvers Lake on February 25th. The highest mean temperature was 76.6° at Vineland, and the lowest, 50.4° at Charlotteburg. The greatest annual range of temperature was 103° at Layton, being from 98° to -5°.

The average precipitation for the State, for the year, was 38.16 inches, which was 8.08 inches below the normal. The greatest monthly average was 4.32 inches in August, and the least, 0.97 inch in October. The greatest monthly precipitation was 8.01 inches at Trenton in August, and the least, 0.33 inch at Long Branch in October. The greatest annual precipitation was 46.78 inches at Dover, and the least, 29.91 inches at Cape May City. The average snowfall for the State was 23.9 inches, which was 7 inches below the normal. The greatest annual snowfall was 9.4 inches at Layton, and the least, 8.0 inches at Atlantic City.

The average number of days on which 0.01 inch or more of precipitation occurred was 115, which was 1 more than the normal. The average number of clear days was 167, which was more than the normal; partly cloudy, 90, which was 26 less than the normal; cloudy, 108, or normal.

The prevailing wind direction was from the southwest; the highest velocity was 72 miles per hour, sustained for 5 consecutive minutes, from the northeast at Long Branch on May 5th. Unimportant occurrences of hail were on June 28th and 29th, August 7th, and November 2d. Minor damage from hail occurred on July 31st and September 3d. Considerable damage from hail occurred at Burlington on June 27th, and at Waterford on July 26th.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVII. TRENTON, N. J., JANUARY, 1922. No. 1.

### GENERAL SUMMARY.

The one outstanding feature of the weather in New Jersey during January, 1922, was the general moderately low temperature, without notably severe cold days. The month averaged one of the nine coldest Januarys since 1885, and continued the remarkable alternation of warm and cold months which began in 1917. From the 12th to the close of the month, subnormal warmth prevailed rather persistently, except for a brief warm period from the 18th to the 20th. Rain, snow and cloudiness were deficient, and sunshine was in slight excess.

A severe storm passed over the State on the 11th, the center moving northeastward, just beyond the coast line. The pressure fell to 28.74 inches, and there was considerable wind damage in all portions of the State, and along the shore destruction was caused by the waves. Another storm on the 28th-29th covered the State with snow, the greatest depths being in central and southwestern counties, many sections being blockaded temporarily; drifts in some cases were 12 or more feet deep. Rail traffic was somewhat, but not seriously, interrupted. Highways would have been effectively blocked, except for the snow removal operations along principal routes.

Fairly satisfactory ice crops were gathered for commercial purposes from central counties northward.

Storm warnings were displayed along the coast on the 2d, 4th, 10th, 11th, 14th, 15th, 17th, 22d, 27th, 28th, and 29th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 27.6°, which was 2.3° below the normal. The highest temperature was 57° at Asbury Park on the 5th, and the lowest, 13° below zero at Culvers Lake on the 26th. The greatest daily range of temperature was 45° at Layton on the 10th. The highest monthly mean was 32.4° at Cape May City, and the lowest, 22.6° at Charlotteburg.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, -2.5°; Red Sandstone Plain, -2.8°; Southern Interior, -2.1°; Sea Coast, -1.3°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 43 stations, was 2.62 inches, which was 0.99 inch below the normal. The greatest monthly precipitation was 4.13 inches at Tuckerton, and the least, 1.08 inches at Monton. The average total snowfall was 11.1 inches, which was 2.2 inches above the normal; this average ranged from 12.0 inches in the Highlands to 7.5 inches on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 2.11 inches at Hammonton on the 11th. The average number of days on which .01 inch or more of precipitation fell was 8, which was 3 less than the normal.

The precipitation accumulated departure from the normal for the year 1922 to date, by sections, is: The Highlands, -1.67 inches; Red Sandstone Plain, -1.54 inches; Southern Interior, -0.18 inch; Sea Coast, -0.51 inch.

### WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement was 16 miles per hour, which was 2 miles above the normal. The highest velocity, sustained for 5 consecutive minutes, was 78 miles per hour from the northeast at Long Branch on the 11th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was 5 more than the normal; partly cloudy, 6, or 3 less than the normal; cloudy, 10, or 2 less than the normal. The per cent of possible sunshine was 52, which was 2 per cent above the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.18 inches, which was 0.07 inch above the normal. The highest reading was 30.72 inches at Cape May City on the 25th, and the lowest, 28.74 inches at Sandy Hook and Trenton on the 11th.

The mean stage of the Delaware River at Phillipsburg was 1.7 feet, and the highest, 2.5 feet on the 5th, 8th, and 9th. At Trenton the mean daily stage was 1.5 feet, which was 2.1 feet below the normal. The highest stage was 1.6 feet on the 21st, and the lowest, 1.0 foot on the 30th and 31st.

Dense fog occurred on the 4th, 5th, 9th, 10th, 18th, 19th, and 20th. Haze occurred on the 17th. Sleet was observed quite generally throughout the northern half of the State on the 11th and 21st, and at a few stations on the 3d, 4th, 5th, 8th, 18th, and 28th. Solar halos were observed on the 6th, 7th, 8th, 10th, 17th, 23d, 27th, and 31st, and lunar halos on the 3d, 6th, 10th, 11th, and 15th. The aurora was observed on the 3d and 10th.

† On other dates also.

‡ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, \*, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion.

Daily Precipitation for January, 1922.

MAR 29 1922

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVII. TRENTON, N. J., FEBRUARY, 1922. No. 2.

## GENERAL SUMMARY.

The general weather conditions of the month were without special feature. There were slight deficiencies in all the usual elements, except warmth, of which there was little excess. The temperature in February of 1922 in New Jersey averaged the same as in 1919, and was only slightly cooler than in 1921. These warm months, taken in connection with the popular psychological belief that our winters are now milder than formerly, are grasped as tending to prove this belief. This belief is erroneous as is easily shown by comparing the mean of the average temperatures of the 19 years from 1885 to 1903, inclusive, with the 19 years from 1904 to 1922, inclusive; 30.6° for the earlier period, as against 29.7° for the latter. Namely, our winters, or rather, months of February, have been colder in recent years than in earlier times. But it is not safe to assert that these figures prove what they appear to. In the earlier days of observations there were not so many carefully trained observers as now, and instrumental exposure was not so uniformly correct as now, and the earlier inaccuracies would more likely tend to readings slightly too high than too low. It would therefore seem more in keeping with the figures and all other applicable facts to assert that the last 19 Februaries were the same in warmth and coldness as the 19 Februaries immediately preceding.

The coldest weather of the winter occurred on the 17th, when temperatures were generally below zero. Except from the 14th to the 18th, the temperature was mostly above normal.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 33.6°, which was 4.0° above the normal. The highest temperature was 73° at Camp Dix on the 14th, and the lowest, 18° below zero at Culvers Lake on the 17th. The greatest daily range of temperature was 45° at Indian Hills on the 1st. The highest monthly mean was 38.2° at Highland, and the lowest, 28.6° at Charlotteburg.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, +1.2°; Red Sandstone Plain, +0.4°; Southern Interior, +1.1°; Sea Coast, +1.0°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 39 stations, was 2.94 inches, which was 0.63 inch below the normal. The greatest monthly precipitation was 6.0 inches at Cape May City, and the least, 1.80 inches at Essex. The average total snowfall was 8.5 inches, which was 1.5 inches below the normal; this average depth ranged from 9 inches in the Highlands to 7.0 inches on the Red Sandstone Plain. The greatest precipitation accumulated in any 24 consecutive hours was 1.40 inches at South Orange on the 15th. The average number of days on which 0.01 inch or more of precipitation fell was 10, which was 1 more than the normal.

The precipitation accumulated departure from the normal for the year 1922 to date, by sections, is: The Highlands, -2.71 inches; Red Sandstone Plain, -2.31 inches; Southern Interior, -0.45 inch; Sea Coast, -0.89 inch.

## WIND.

The prevailing wind direction was from the northwest, with a velocity of 14 miles per hour, which was normal. The highest wind velocity, sustained for 5 consecutive minutes, was 58 miles per hour from the southwest at Atlantic City on the 2d. High winds were noted also on the 3d, 8th, 23d, and 28th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 10, which was 1 less than the normal; partly cloudy days, 8, or normal; cloudy days, 10, which was 1 more than the normal. The per cent of possible sunshine was 51, which was 5 per cent below the normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.14 inches, which was 0.04 inch above the normal. The highest reading was 30.64 inches at Ridgefield on the 14th, and the lowest, 29.42 inches at Sandy Hook and Trenton on the 2d.

The mean stage of the Delaware River at Phillipsburg was 3.3 feet, and the highest stage was 8.0 feet on the 25th. At Trenton the mean daily stage was 2.9 feet, which was 0.4 foot below the normal. The highest stage was 10.5 feet on the 3d, and the lowest, 1.3 feet on the 1st and 6th.

Dense fog occurred on the 1st, 2d, 3d, 5th, 6th, 10th, 11th, 15th, 19th, 20th, 21st, 22d, 23d, and 26th. Sleet was observed at a few stations on the 13th, 16th, 19th, 26th, and 27th, and quite generally throughout the State on the 12th and 15th. Solar halos were observed on the 4th, 9th, 17th, 18th, 22d, 24th, and 25th; and lunar halos on the 4th, 7th, and 12th. Thunderstorms occurred over the northern half of the State on the night of the 12th-13th, and were attended by hail at several stations.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsico.

Daily Precipitation for February, 1922.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.  
CHARLES F. MARVIN, Chief.

APR 29 1922

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist,

VOL. XXVII. TRENTON, N. J., MARCH, 1922. No. 3.

## GENERAL SUMMARY.

The weather during the month of March, 1922 in New Jersey, as, for the most part, typical, the main exceptions being that the disagreeable characteristics were slightly less rigorous than as frequently been the case. There were periods of subnormal warmth at the beginning of the month, again in the third week, and at the close, but these deficiencies were not severe. The other portions of the month were warm, favorable to out-of-door occupations, and more than counterbalanced the less auspicious periods.

There was an excess of warmth, moisture and cloudiness, but a very agreeable deficiency of snow and blustery weather. A few inches of snow fell over northern districts on the 2d, but there was none thereafter except a few unimportant flurries. The progress of vegetation was slow but constant, and there was actually no forcing of buds, and excessive development was checked by temperatures close to freezing at the close of the month.

Streams and ponds returned to a normal level, but there continued to be indications of a slight deficiency of ground water. Snowing was somewhat difficult in some districts on account of lack of soil moisture.

Storm warnings were displayed along the coast on the 1st, 3d, 5th, 6th, 7th, 10th, 15th, 19th, 20th, 21st, 30th and 31st.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 36 stations was 41.1°, which was 2.6° above the normal. The highest temperature was 82° at Long Branch on the 26th, and the lowest, 2° at Culvers Lake and Layton on the 1st. The highest monthly mean temperature was 44.6° at Edgewater, Moorestown, and Vineland, and the lowest, 36.4° at Layton. The greatest daily range of temperature was 49° at Charlotteburg on the 26th.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, +1.6°; Red Sandstone Plain, +1.0°; Southern Interior, +1.7°; Sea Coast, +1.4°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 40 stations was 4.52 inches, which was 0.64 inch above the normal. The greatest monthly precipitation was 7.10 inches at Newark, and the least, 3.42 inches at Indian Mills. The average total snowfall was 3.7 inches, which was 2.2 inches above the normal; this average ranged from 7.2 inches in the Highlands to 1.4 inches in the Southern Interior. The greatest precipitation accumulated in any 24 consecutive hours was 1.87 inches at Newark on the 7th. The average number of days on which .01 inch or more of precipitation fell was 13, which was more than the normal.

The precipitation accumulated departure from the normal for the year 1922 to date, by sections, is: The Highlands, -1.94 inches; Red Sandstone Plain, -1.20 inches; Southern Interior, -0.25 inch; Sea Coast, -0.47 inch.

## WIND.

The prevailing wind direction was from the northwest, with a velocity of 15 miles per hour, which was 1 mile above the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 68 miles per hour from the south on the 7th at Atlantic City.

## SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 12, which was 2 less than the normal; partly cloudy 6, which was 2 less than the normal; cloudy, 13, which was 4 more than the normal. The mean per cent of possible sunshine was 52, which was 9 per cent below the normal.

## MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 6.7 feet, and the highest, 15.0 feet on the 9th. At Trenton the mean daily stage was 4.2 feet, which was 0.1 foot above the normal; the highest stage was 9.8 feet on the 9th.

The mean atmospheric pressure, reduced to sea level, was 30.11 inches, which was 0.10 inch above the normal. The highest reading was 30.72 inches at Sandy Hook on the 1st, and the lowest, 29.31 inches at Sandy Hook on the 7th. Dense fog was reported on the 4th, 7th, 10th, 13th, 20th, 26th, 27th, and 28th. Haze was observed on the 6th and 9th, and smoke on the 26th. Sleet occurred generally throughout the State on the 2d, 4th, and 30th, and at a few stations on the 1st, 5th, 11th, 12th, 15th, 20th, and 31st. Solar halos were observed on the 1st, 3d, 7th, 9th, 13th, 14th, 18th, 19th, 24th, 26th, 27th, and 28th and lunar halos on the 2d and 9th. Thunderstorms occurred in some portions of the State on the 2d, 7th, 20th, 28th, 29th, and 31st.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

about five miles from Woodbine, and will be considered as a continuation of the Woodbine station.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsila; New Milford and Woodcliff are Weehawken.

Daily Precipitation for March, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist,

VOL. XXVII. TRENTON, N. J., APRIL, 1922. No. 4.

### GENERAL SUMMARY.

The great variability of April weather was well exemplified in New Jersey in 1922. A steady warm period from the 6th to the 18th was preceded and followed by subnormal temperatures. Characteristic frequency of rainfall up to the 19th was followed by a virtual absence of moisture that gradually tended toward drought conditions. Early in the month and later in the month there were a few mornings when temperatures were below freezing, but during the warm intervening period, agricultural growth made a substantial advance, only to be checked later by the cold. Some fruit bloom was injured, but the loss was much less than last year. In many sections the ground was so dry and hard that plowing was difficult and unsatisfactory, and the general level of ground waters was low for so early in the season. The days of highest and lowest temperatures were attendant upon the occurrences of lowest and highest pressure, respectively. The month, as a whole, was favorable for out-of-door operations, but was unfavorable for agriculture.

Storm warnings were displayed along the coast on the 1st, 2d, 11th, 17th, 18th, 19th, and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations was 51.0°, which was 1.5° above the normal. The highest temperature was 89° at Paterson on the 10th, and the lowest, 18° at Culvers Lake on the 21st, and Layton on the 22d. The highest monthly mean temperature was 55.0° at Bridgeton, and the lowest, 47.4° at Charlotteburg. The greatest daily range of temperature was 45° at Layton on the 29th.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, +1.5°; Red Sandstone Plain, +1.1°; Southern Interior, +1.7°; Sea Coast, +1.6°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 2.55 inches, which was 1.08 inches below the normal. The mean total snowfall was trace, which was 0.8 inch below the normal. The greatest monthly precipitation was 4.12 inches at Hightstown, and the least, 1.57 inches at Woodcliffe Lake. The greatest amount of precipitation in any 24 consecutive hours was 1.30 inches at Phillipsburg on the 14th-15th. The mean number of days on which 0.01 inch or more of precipitation occurred was 10, or normal.

The precipitation accumulated departure from the normal for the year 1922 to date, by sections, is: The Highlands, -2.26 inches; Red Sandstone Plain, -2.39 inches; Southern Interior, -1.43 inches; Sea Coast, -1.94 inches.

### WIND.

The prevailing wind direction was from the northwest, with a velocity of 14 miles per hour, which was 1 mile above the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 56 miles per hour from the south at Atlantic City and Sandy Hook on the 11th. High winds were reported also on the 20th.

### SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 15, which was 4 more than the normal; partly cloudy, 7, which was 3 less than the normal; cloudy, 8, which was 1 less than the normal. The per cent of possible sunshine was 66, which was 9 per cent above the normal.

### MISCELLANEOUS.

The mean daily stage of the Delaware River at Phillipsburg was 6.0 feet, and the highest stage, 9.0 feet on the 16th. At Trenton the mean stage was 3.8 feet, which was 0.1 foot below the normal; the highest stage was 5.2 feet on the 16th.

The mean atmospheric pressure, reduced to sea level, was 30.08 inches, which was 0.08 inch above the normal. The highest reading was 30.47 inches at Cape May City on the 24th, and the lowest, 29.22 inches, at Trenton on the 11th.

Dense fog was reported on the 5th, 11th, and 21st. Sleet in inappreciable amounts occurred at Culvers Lake on the 1st and at Ridgefield on the 23d. Solar halos were observed on the 3d, 6th, 9th, 11th, 14th, 25th, 26th, and 28th; and lunar halos on the 2d, 6th, 9th, and 10th. Thunderstorms occurred on the 1st, 9th, 11th, 12th, 14th, and 21st. The aurora was observed on the 11th. Hail fell at Belvidere and Layton on the 12th, Phillipsburg on the 15th, Lambertville and New Brunswick on the 20th, and at South Orange on the 23d; no damage was reported. A meteor was observed at Indian Mills and Lakewood on the 23d. There were no killing frosts in the southern portion of Cape May County; elsewhere they occurred quite generally on the 3d, 6th, 22d, 23d, 24th, and 25th, and at scattered stations on the 21st, 29th, and 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

The station at Belle Plain is

about five miles from Woodbine, and will be considered as a continuation of the Woodbine station.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff are Weehawken.

Daily Precipitation for April, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist,

VOL. XXVII. TRENTON, N. J., MAY, 1922. No. 5.

### GENERAL SUMMARY.

The weather during May, 1922, was remarkably pleasant in New Jersey. There was an excess over the normal warmth on each day except the 1st, 17th, 27th and 28th; there was an excess of sunshine, but a normal amount of rain, although it occurred on 3 fewer days than normal. Rain during May is a widely variable quantity, and has varied over the State years past from 15.6 inches to under one-tenth of an inch. Temperatures are less erratic, and State means have ranged but slightly over 11°. The first day of the month was the coldest, and temperatures rose with fair regularity to the close. Rain was not well distributed; nearly all of it occurring by the 18th, there being none to amount to anything thereafter. This long, dry period developed into a threatened drought, and plant life was not in very favorable condition at the close of the month. It was, however, one of the best months for out-of-door work that is likely to occur in the Spring. The air was hazy on about 18 days, and many forest fires occurred. There was an unusual absence of severe convectional storms.

Storm warnings were displayed along the coast on the 18th and 19th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 63.0°, which was 2.6° above the normal. The temperature was 90° at Phillipsburg on the 26th and Burlington on the 30th, and the lowest, 23°, at Charlotteburg on the 1st. The highest monthly mean temperature was 66.1° at Bridgeton and Vineland, and the lowest, 59.0° at Charlotteburg. The greatest daily range of temperature was 47° at Charlotteburg on the 1st.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, +1.7°; Red Sandstone Plain, +1.4°; Southern Interior, +1.9°; Sea Coast, +1.9°.

### PRECIPITATION.

The average total precipitation of the State, as deduced from observations of 45 stations, was 3.84 inches, which was 0.04 inch above the normal. The greatest monthly amount was 7.55 inches at Newark, and the least 1.16 inches at Northfield. The greatest amount accumulated in any 24 consecutive hours was 3.30 inches at Boonton on the 19th. The average number of days on which .01 inch or more of rain fell was 8, which was 3 less than the normal.

The accumulated precipitation departure from the normal for the year 1922 to date, by sections, is: The Highlands, -1.73 inches; Red Sandstone Plain, -1.23 inches; Southern Interior, -2.53 inches; Sea Coast, -2.82 inches.

### WIND.

The prevailing wind direction was from the south, with an hourly velocity of 12 miles, which was 1 mile above the normal. The highest velocity, sustained for 5 consecutive minutes, was 2 miles per hour from the east at Atlantic City on the 27th. High winds were noted also on the 11th and 19th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, which was 6 more than the normal; partly cloudy, 6, or 4 less than the normal; cloudy 7, or 2 less than the normal. The per cent. of possible sunshine was 71, which was 11 per cent. above the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.01 inches, which was 0.02 inch above the normal. The highest reading was 30.54 inches at Cape May City on the 1st, and the lowest, 29.43 inches at Trenton on the 19th.

The mean stage of the Delaware River at Phillipsburg was 3.6 feet, and the highest, 6.0 feet on the 20th. At Trenton the mean daily stage was 2.3 feet, which was 0.3 feet below the normal; the highest stage was 3.8 feet on the 21st.

Killing frost was noted at Charlotteburg, Layton, Plainfield, Ridgefield, and Tuckerton on the 1st; heavy frost at Dover, New Brunswick, Belle Plain, and Pleasantville on the 1st; and light frost at Camp Dix, Flemington, Northfield, and Trenton on the 1st, at Flemington on the 2d, at Camp Dix, Layton, and New Lisbon on the 13th, and at New Lisbon on the 28th. Thunderstorms occurred in some portion of the State on the 11th, 15th, 18th, 19th, 22d, 26th, and 27th. Solar halos were observed on the 1st, 2d, 3d, 9th, 10th, 13th, 14th, 18th, 25th, and 26th, and lunar halos on the 8th and 9th.

### ERRATA.

March 1922: Pages 10 and 11: Highwood, total precipitation should read 4.96 inches instead of 3.96 inches; departure, +0.78 instead of -0.22; page 11, amount on 20th should read 1.09 instead of 0.09.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

The station at Belle Plain is

about five miles from Woodbine, and will be considered as a continuation of the Woodbine station.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff are Weehawken.

## Daily Precipitation for May, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist,

VOL. XXVII. TRENTON, N. J., JUNE, 1922. No. 6.

### GENERAL SUMMARY.

The average warmth of June 1922, in New Jersey has been exceeded but three times, in 1889, 1895, and 1892, in the past 37 years. The excess of temperature persisted on every day except the 5th, 12th, 17th, and 27th-28th, and was effectual through the high night-time temperatures, rather than through great heat during the middle of the day. In fact the extreme maximum for the State was but 95°, which is normally very consistently exceeded in June.

The other weather feature of the month was the persistent and copious rain, which fell very generally on the first six days, then on the 11th, and from the 17th to the 28th, except that there were scattered dry spots on the 19th, 23d, 24th and 26th.

The heaviest amounts of rain were attendant upon violent thundershowers, notably on the 5th, 11th and 28th.

As would be expected, with unusual frequency of rain, sunshine was deficient, and farm work became considerably hampered, especially in the matter of cultivation, and harvest of hay. The growth of vegetation, however, was notably vigorous and rapid.

Storm warnings were displayed along the coast on the 18th-19th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 71.1°, which was 2.5° above the normal. The highest temperature was 95° at Asbury Park on the 11th, and the lowest, 39° at Belle Plain on the 13th. The highest monthly mean temperature was 74.2° at Moorestown, and the lowest, 66.6° at Charlotteburg. The greatest daily range of temperature was 43° at Belle Plain on the 13th.

The temperature departure from the normal for the year 1922, to date, by sections, is: The Highlands, +1.8°; Red Sandstone Plain, +1.5°; Southern Interior, +2.0°; Sea Coast, +2.0°.

### PRECIPITATION.

The average total rainfall for the State, as deduced from observations of 45 stations, was 6.31 inches, which was 2.52 inches above the normal. The greatest monthly amount was 11.50 inches at Newark, and the least, 2.97 inches at Northfield. The greatest amount of rain in 24 consecutive hours was 6.05 inches at Lakewood on the 28th. The average number of days on which 0.01 inch or more rain fell was 15, which was 6 more than the normal. The precipitation accumulated departure from the normal for the year 1922, to date, by sections, is: The Highlands, +0.62 inch; Red Sandstone Plain, +2.38 inches; Southern Interior, -1.03 inches; Sea Coast, -0.05 inch.

### WIND.

The prevailing wind direction for the month was from the southwest, with an average velocity of 11 miles per hour, which was 1 mile above the normal. The highest velocity for the month, sustained for five consecutive minutes, was 50 miles per hour from the west on the 11th at Sandy Hook. High winds were also noted on the 12th, 17th, and 21st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was

12, or normal; partly cloudy, 9, which was 2 less than the normal; cloudy, 9, which was 2 more than the normal. The percentage of possible sunshine was 56, which was 5 per cent less than the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 3.6 feet, and the highest stage, 6.0 feet on the 20th. At Trenton the mean daily stage was 2.8 feet, which was 0.9 foot above the normal; the highest stage was 6.1 feet on the 5th.

The mean atmospheric pressure, reduced to sea level, was 29.98 inches, which was normal. The highest reading was 30.20 inches at Cape May City on the 6th, and the lowest, 29.48 inches at Sandy Hook on the 11th.

Thunderstorms occurred in some portions of the State on the 3d, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 17th, 18th, 21st, 22d, 24th, 25th, 27th, 28th, and 29th. Solar halos were observed on the 8th, 11th and 27th, and a lunar halo on the 4th. Dense fog occurred on the 1st, 2d, 5th, 7th, 8th, 16th, 19th, 20th, 21st, 27th, and 29th.

### HAIL.

May 1922: Hail occurred at Chatham, Culvers Lake, and Dover on the 19th, and at Belle Plain on the 28th; the amounts were small and the damage inappreciable.

June 1922: Little damage resulted from hail at Layton on the 6th, Kearny, Sandy Hook, and South Orange on the 11th, and at Trenton on the 21st.

### ERRATA.

May 1922: Bergen Point, omit maximum temperatures on the 15th, 27th, and 29th, and minimum temperature on the 13th. Mean maximum temperature should read 74.1°, and mean minimum 53.2°. Monthly mean temperature should read 63.6°.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

The station at Belle Plain is

about five miles from Woodbine, and will be considered as a continuation of the Woodbine station.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff are Weehawken.

## Daily Precipitation for June, 1922.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVII.

JULY, 1922.

No. 7.

### GENERAL SUMMARY.

The weather over the State, as a whole, during July, was much like that of June, except that it was a little warmer, although temperatures were not quite up to the monthly normal. Rainfall and cloudiness were slightly less than during June, and altogether it was a somewhat more favorable month for out-of-door pursuits. The warmest period was the 12th-13th, when temperatures were well up in the 90's over practically the entire State except the immediate ocean shore. The rainfall was very generously distributed as to quantity and frequency over all portions of the State, except that there was an appreciable deficiency along the Delaware River from Hunterdon County southward. In many northern and northeastern districts the excess of rain was a considerable detriment to crop growth and harvest of grass and grains. It rained very generally from the 1st to the 5th, 8th, 13th-14th, and 18th and 19th, over all portions of the State, on the 20th and 22d in the south, on the 24th-25th in the north, 27th in the south, and 28th in the north. The storm on the 1st was very heavy especially in northeastern districts, and cloudiness became so dense as to require artificial illumination during mid-day. The storms of the 13th and 18th were also severe in various localities. No storm warnings were displayed along the coast during the month.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 40 stations, was 73.0°, which was 0.7° below normal. The highest temperature was 98° at Sussex on the 12th, and the lowest, 44° at Layton on the 30th. The highest monthly mean temperature was 76.0° at Bridgeton and Burlington, and the lowest, 68.6° at Charlotteburg. The greatest daily range of temperature was 40° at Sussex on the 30th. The temperature departure for the year 1922 to date, by sections, is: The Highlands, +1.5°; Red Sandstone Plain, +1.1°; Southern Interior, +1.7°; Sea Coast, +1.7°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations at 46 stations was 5.79 inches, which was 1.00 above normal. The greatest monthly rainfall was 9.26 inches at Plainfield, and the least, 2.29 inches at Trenton. The greatest amount of rain in any 24 consecutive hours was 3.50 inches at Vineland on the 14th. The mean of the number of days on which 0.01 inch or more of rain fell was 13, or 3 more than the normal. The precipitation accumulated departure from normal for the year 1922 to date, by sections, is: The Highlands, +1.37 inches; Red Sandstone Plain, +4.23 inches; Southern Interior, -0.58 inches; Sea Coast, +0.39 inch.

### WIND.

The prevailing wind direction was from the south, with an

approximate velocity of 11 miles per hour, which was about one mile above normal. The highest velocity, sustained for 5 consecutive minutes, was 59 miles per hour from the south on the 18th at Sandy Hook.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than normal; partly cloudy, 9, or 3 less than normal; cloudy, 9, or 2 more than normal. The approximate percentage of possible sunshine was 61, which was 2 below normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 3.0 feet, and the highest stage, 7.0 feet on the 4th. At Trenton the mean stage was 1.7 feet, which was 0.4 feet above normal. The highest stage, 4.3 feet, occurred on the 4th.

Thunderstorms occurred in some portions of the State on the 1st, 2d, 3d, 4th, 5th, 8th, 12th, 13th, 14th, 17th, 18th, 19th, 20th, 22d, 23d, 24th, 27th, 28th, 29th, and 31st.

Haze was noted daily from the 6th to the 10th, and from the 12th to the 23d.

Solar halos were observed on the 15th, 19th, and 23d. Hail occurred as follows: 13th, severe damage at Ridgefield; 28th, slight damage at Dover, Layton, Sussex, Newark, and South Orange; severe damage at Chatham.

The mean atmospheric pressure, reduced to sea level, was 30.03 inches, which was 0.05 inch above the normal. The highest reading was 30.26 inches on the 16th, and 26th, and the lowest 29.69 on the 3d.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff are Weehawken.

## Daily Precipitation for July, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

Vol. XXVII.

AUGUST, 1922.

No. 8.

### GENERAL SUMMARY.

The weather during August was generally typical of normal conditions at this time of the year, warmth, moisture and wind being much like the average of previous years. There was a persistent deficiency of bright sunshine during nearly all portions of the month except toward the end of the third week, when there were several nearly cloudless days. On the other hand, the number of cloudy days was not unduly large. Frequency of rain continued to be a prominent feature, as in the immediate preceeding months, but the amount was not fully up to normal quantity. The third week was the most pleasant of the month, with but a brief rainy period, ample sunshine and the only consecutive period which was above normal in warmth. In all otehr periods temperatures were consistently subnormal.

Oppressive humidity was an unpleasant feature during the earlier half of the month, but less so later. Altogether it has not been a summer that has been conducive to out-of-door recreation, it has been somewhat more advantageous than usual for erop growth and construction operations, as well as most farm pursuits. The Southern Interior was the warmest and wettest section of the State.

Storm warnings were displayed along the coast on the 7th and 25th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 71.2°, which was 0.9° below the normal. The highest temperature was 96° at Bergen Point, Elizabeth, and Phillipsburg on the 17th, and the lowest, 39°, at Charlotteburg on the 22d. The highest monthly mean temperature was 73.8° at Bridgeton and Imlaystown, and the lowest, 66.1° at Charlotteburg. The greatest daily range of temperature was 41° at Charlotteburg on the 22d.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, +1.2°; Red Sandstone Plain, +0.9°; Southern Interior, +1.4°; Sea Coast, +1.4°.

### PRECIPITATION.

The average total rainfall of the State, as deduced from observations of 44 stations, was 4.03 inches, which was 0.65 inch below the normal. The greatest monthly amount was 6.78 inches at Hammonton, and the least, 2.18 inches at Ridgefield. The greatest amount accumulated in any 24 consecutive hours was 2.19 inches at Cape May City on the 26th-27th. The average number of days on which .01 inch or more rain fell was 12, which was 2 more than the normal.

The accumulated precipitation departure from the normal for the year 1922 to date, by sections, is: The Highlands, +0.84 inch; Red Sandstone Plain, +2.84 inches; Southern Interior, -0.61 inch; Sea Coast, +0.04 inch.

### WIND.

The prevailing wind movement was from the southwest, with an average velocity of 12 miles per hour, which was 3 miles per

hour, above the normal. The highest velocity, sustained for 5 consecutive minutes, was 50 miles per hour from the southeast at Atlantic City on the 31st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State, was 13, or normal; partly cloudy, 9, or 2 less than the normal; cloudy, 9, or 2 more than the normal. The per cent of possible sunshine was 58, which was 8 per cent less than the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was normal. The highest reading was 30.34 inches at Cape May City on the 13th, and the lowest, 29.64 inehes at Sandy Hook and Trenton on the 7th.

The mean stage of the Delaware River at Phillipsburg was 1.0 foot; and the highest stage 2.0 feet on the 6th. At Trenton the mean daily stage was 0.7 foot, which was 0.4 foot below the normal. The highest stage was 1.3 feet on the 5th.

Hail fell, without appreciable damage, at Layton on the 1st, Bridgeton on the 3d, Cape May City on the 5th, Jersey City on the 7th, and Layton and Sandy Hook on the 31st.

Thunderstorms occurred in some portions of the State on the 1st, 2d, 3d, 4th, 5th, 7th, 8th, 9th, 12th, 14th, 16th, 17th, 19th, 20th, 26th, 27th, 30th, and 31st. Dense fog was noted on the 2d, 3d, 4th, 5th, 14th, 15th, 26th, 27th, and 29th. Light haze prevailed in various localities from the 4th to the 12th, and also on the 1st, 2d, 14th, 17th, 18th, 24th, and 30th. Solar halos were observed on the 10th, 11th, and 24th.
